World Class Solenoid Valves

Excellence By Control

**PETER
PAUL**

We at Peter Paul put a heavy emphasis on the word *quality*. In describing our products, quality is the most important term. One of the rewards of being in a specialized business like ours for over 35 years is a thorough knowledge of all the facets of manufacturing and development of superior valves and operators.

Peter Paul has kept pace with every improvement that has been made available both in material and techniques. Our fully staffed design, research and development departments consistently bring new exciting products to the world's marketplace.

Accurate, high speed manufacturing, top quality components are only part of the picture. Dedication to customers' needs, both in service and delivery, is a very significant quality. Our sales department is ready to answer questions and solve problems. Please feel free to call.

The Peter Paul people are proud of their growth, their business vitality, their reputation, and their products.

TABLE OF CONTENTS

PRODUCT GUIDE (pages 4-5)

GENERAL PURPOSE VALVES (pages 6-21)

Series 15	6-7
Series 20, 30, 50 & 70	
Two Way Normally Open	8-9
Two Way Normally Closed	10-11
Three Way Normally Closed (Exhaust to Atmosphere)	12-13
Three Way Normally Closed (Piped Exhaust)	14-15
Three Way Normally Open	16-17
Three Way Directional Control	18-19
Three Way Multi Purpose	20-21

EXPLOSION PROOF VALVES / LOW WATT VALVES & HIGH PRESSURE VALVES (pages 22-39)

Series 20 (Explosion Proof) Two Way and Three Way Valves	22-23
Series 20 (Explosion Proof) Three Way Valves	24-25
Series 20 (Explosion Proof / High Pressure) Two Way Normally Open	26-27
Series 20 (Explosion Proof / High Pressure) Two Way Normally Closed	28-29
Series 20 (Explosion Proof / High Pressure) Three Way Normally Closed	30-31
Series 50 EW Explosion Proof	32-33
Series E50 Miniature-Explosion Proof	34-35
Series EL50 Miniature Explosion Proof / Low Watt	36-37
Series 50 ELW & ELLW Explosion Low Watt	38-39

LOW WATT VALVES (pages 40-43)

Series 50 SLW & SLLW Super Low Watt	40-41
Series 50 LW & LLW Low Watt	42-43
Series S58 Uprated Pressure	44-45

PLASTIC BODY VALVES (pages 44-49)

Series 58 Mini Valve & Pilot Operators	46-47
Series 40 Plastic Valves	48-49

HIGH FLOW VALVES (pages 50-53)

Series 20 High Flow Low Pressure	50
Series 70 High Flow	51
Series 80 Large Orifice	52-53

SPECIAL APPLICATIONS (pages 54-59)

Series 30 Model F32 Filter Valve	54
Series 50 Media Isolation Valve	55
Series 20 Magnetic Latching Valve	56-57

SPECIFICATION FORM 003A

The physical portion of Peter Paul's operation consists of a 77,000 square foot plant in New Britain, Connecticut, and 23,500 square foot facility in Fajardo, Puerto Rico. These buildings are home to outstanding design, research / development, and manufacturing. The Peter Paul environment is more importantly an organization of people – people with years of experience, dedication and pride, people who bring you products that have a reputation for excellence.

SOLENOID VALVES . . .

SERIES 58

Smallest in the line — low cost, low power consumption, high performance. Ideally suited for solid state controls.

2-WAY LEAD WIRES

2-WAY DIN CONNECTOR

3-WAY LEAD WIRES

3-WAY
WITH MANUAL OVERRIDE
DIN CONNECTOR

SERIES 15

The little black box — magnetic components encased in epoxy for durability and reliability. Interior parts are stainless steel and anodized aluminum.

MALE EXPORT STYLE
DIN CONNECTOR

CONDUIT
LEAD WIRES

3-WAY W/FEMALE
DIN CONNECTOR

3-WAY
LEAD WIRES

SERIES 50

Our original mini — engineered for space economy without sacrificing performance. Typical applications include medical, analytical instrumentation.

2-WAY CONDUIT

2-WAY GROMMET

3-WAY GROMMET

3-WAY CONDUIT

SERIES 30

Complete range of two-way and three-way valves particularly suitable when cost and size are major factors. The bodies are constructed of brass (2-way normally closed, brass or stainless steel is standard).

2-WAY CONDUIT

2-WAY GROMMET

3-WAY GROMMET

3-WAY CONDUIT

SERIES 20

A complete line of two-way and three-way valves with a great selection of options. Exceptional proven performance. The standard in the field.

2-WAY CONDUIT

2-WAY GROMMET

3-WAY GROMMET

3-WAY CONDUIT

SERIES 70

SUPER VALVES
2- and 3-way valves having ratings that formerly required valves of much greater size.

2-WAY CONDUIT

2-WAY GROMMET

3-WAY GROMMET

3-WAY CONDUIT

**PETER
PAUL**

SOLENOID VALVES . . .

EXPLOSION PROOF For hazardous locations proven and tested to meet UL and CSA requirements. Safe and continuous operation at maximum pressures.

3-WAY PIPED EXHAUST

SERIES EH20
HIGH PRESSURE IMPACT TYPE
2-WAY NORMALLY CLOSED

SERIES EH20
HIGH PRESSURE IMPACT TYPE
3-WAY NORMALLY CLOSED

SERIES EH20
HIGH PRESSURE IMPACT TYPE
2-WAY NORMALLY OPEN

HIGH PRESSURE Super high pressure ratings with bubble tight sealing. Ratings to 3000 psi.

SERIES EH20
HIGH PRESSURE EXPLOSION PROOF

SERIES 20
3-WAY NORMALLY CLOSED

SERIES 20
2-WAY NORMALLY CLOSED

HIGH FLOW Two-way, large orifice valves for dump or quick fill.

SERIES 70 HIGH FLOW
2-WAY NORMALLY CLOSED

SERIES 80

SERIES 80
INTERNAL PILOT

SERIES 80
DIRECT LIFT

The Little Black Box that meets the design and application challenges of modern industry

- SMALL
- LIGHTWEIGHT
- ECONOMICAL
- OPERATING PRESSURES FROM VACUUM TO 500 PSI
- QUALITY DESIGN AND CONSTRUCTION

Series 15 is U.L. and CSA Component listed for A.C. only.

This **Series 15** valve group is available as 2-Way Normally Open, 2-Way Normally Closed, and a variety of 3-Way functional combinations to meet your application requirements.

The valves may be used with air, inert gas and liquid media at pressures from vacuum to 500 psi — depending upon orifice size and configuration.

Interior parts are stainless steel and anodized aluminum. All external magnetic components are encased in epoxy for durability and reliability.

For those who require extra heat resistance and media compatibility FKM and other elastomers are available.

Valve Temperature Range: STANDARD VALVES - 0°F (-18°C) to 104°F (40°C) ambient; 0°F (-18°C) to 150°F (65°C) media. OPTIONAL VALVES — can tolerate much higher or much lower ambient and media temperatures. Consult factory for specifics.

Standard valve porting is 1/8 NPT.

Nominal Power:

8.5 Watts AC

7.0 Watts AC (2 Way Normally Closed)

10.5 Watts DC

The entire coil and magnetic structure are epoxy encapsulated and rated for continuous duty.

The "Male Export Style DIN Connector", 24" Lead Wire and Conduit configurations are standard.

For your convenience we have the female DIN style mating connector No. 50-17029 available.

Include voltage and frequency requirements at the end of the valve number for ordering purposes. (Example: 152G2DEM-120V./60HZ)

Valves weigh 4¼ oz. to 4¾ oz. (.27lb. to .30lb.) - depending upon particular model and trim.

Repair Packs—available, consult factory

Stackable Valves, brass and stainless steel round bodies available, consult factory.

FOR FLOW CHARTS SEE PAGES 95-97

2-WAY NORMALLY CLOSED CONDUIT CONNECTION

2-WAY NORMALLY CLOSED WITH LEADS

3-WAY NORMALLY CLOSED WITH DIN STYLE COIL

* Normally closed orifice.

** Pressure rating may change due to the viscosity of the liquid - consult factory for de-rating.

NOTE: The above checked (✓) Valves are most popular based on sales and likely to be in Distributor stock.

SPECIFICATIONS—2-WAY NORMALLY OPEN

OPERATING CONDITIONS

Media: Air, water, and other fluids compatible with standard Buna seals. Hot water, steam gasoline, and many oils require special seal materials - Consult representative or factory. (Series 50 pressure ratings may change due to the viscosity of the liquid-consult factory for de-rating)

Valve Temperature Range: STANDARD VALVES – 0°F (-18°C) to 104°F (40°C) ambient; 0°F (-18°C) to 150°F (65°C) media. OPTIONAL VALVES – can tolerate much higher or much lower ambient and media temperatures. Consult factory for specifics.

Maximum Operating Pressure Differentials: See Catalog listings.

Burst Pressure: Series 20, 30, 50 - 5000 PSI Series 70 - 4000 PSI

Leakage: Bubble tight for standard valves

Vacuum: To 5 Microns - Consult factory

ELECTRICAL CHARACTERISTICS

Coil Voltage: Series 20 - 5 to 825 VAC 50-60 HZ. – 1.8 to 265V DC
Series 30 - 5.2 to 650 VAC 50-60 HZ. – 2 to 240V DC
Series 50 - 5.4 to 575 VAC 50-60 HZ. – 3.0 to 300V DC
Series 70 - 12 to 1050 VAC 50-60 HZ. – 2.5 to 220V DC

Nominal Power:

Series	D.C.	A.C.	Series	D.C.	A.C.
20	9.5	8.7 Watts	50	7.0	6.0 Watts
30	8.0	8.0 Watts	70	16.0	18.0 Watts

Coil Construction: Non-molded Class A, Molded and potted Class F. (Class H optional)

Typical Response Time on Air: 4 - 16 Milliseconds—all series

MECHANICAL CHARACTERISTICS

Body: Stainless steel (standard) - Ser. 20, 50, & 70
Stainless steel (optional) - Ser. 30
Brass (standard) - Ser. 30
Brass (optional) - Ser. 20, 50, & 70 - Consult factory
Aluminum (optional) - Ser. 50 - Consult factory

Orifice Diameter: See catalog listings

Porting: See catalog listings

Housing: Grommet & 1/2" NPT conduit - many options available.

Listings: Most valves are U.L. and CSA listed - Consult factory for specifics.

OPTIONS AVAILABLE: – 2 WAY NORMALLY OPEN

WHEN ORDERING VALVES OR REPAIR PACKS ADD VOLTAGE AND FREQUENCY TO COMPLETE VALVE NUMBER.
EXAMPLES: VALVE (72K9DGV-120/60) REPAIR PACK (K72KDD-AC) See repair pack reference page 82

*FKM seals not recommended for pressure ratings above 500 PSI

NOTE: The above checked (✓) Valves, but with optional molded coils, are most popular based on sales and likely to be in Distributor stock.

3-WAY NORMALLY CLOSED Exhaust to atmosphere

SPECIFICATIONS—3-WAY NORMALLY CLOSED

OPERATING CONDITIONS

Media: Air, water, and other fluids compatible with standard Buna seals. Hot water, steam gasoline, and many oils require special seal materials - Consult representative or factory.

Valve Temperature Range: STANDARD VALVES – 0°F (-18°C) to 104°F (40°C) ambient; 0°F (-18°C) to 150°F (65°C) media. OPTIONAL VALVES – can tolerate much higher or much lower ambient and media temperatures. Consult factory for specifics.

Maximum Operating Pressure Differentials: See Catalog listings.

Burst Pressure: Series 20, 30, 50 - 5000 PSI Series 70 - 4000 PSI

Leakage: Bubble tight for standard valves

Vacuum: To 5 Microns - Consult factory

ELECTRICAL CHARACTERISTICS

Coil Voltage: Series 20 - 5 to 825 VAC 50-60 HZ. – 1.8 to 265V DC
Series 30 - 5.2 to 650 VAC 50-60 HZ. – 2 to 240V DC
Series 50 - 5.4 to 575 VAC 50-60 HZ. – 3.0 to 300V DC
Series 70 - 12 to 1050 VAC 50-60 HZ. – 2.5 to 220V DC

Nominal Power:

Series	D.C.	A.C.	Series	D.C.	A.C.
20	9.5	8.7 Watts	50	7.0	6.0 Watts
30	8.0	8.0 Watts	70	16.0	18.0 Watts

Coil Construction: Non-molded Class A, Molded and potted Class F. (Class H optional)

Typical Response Time on Air: 4 - 16 Milliseconds—all series

MECHANICAL CHARACTERISTICS

Body: Stainless steel (standard) - Ser. 20, 50, & 70
Brass (standard) - Ser. 30
Brass (optional) - Ser. 20, 50, & 70 - Consult factory
Aluminum (optional) - Ser. 50 - Consult factory

Orifice Diameter: See catalog listings

Porting: See catalog listings

Housing: Grommet & 1/2" NPT conduit - many options available.

Listings: Most valves are U.L. and CSA listed - Consult factory for specifics.

OPTIONS AVAILABLE: –

WHEN ORDERING VALVES OR REPAIR PACKS ADD VOLTAGE AND FREQUENCY TO COMPLETE VALVE NUMBER.
EXAMPLES: VALVE (74KK9ZGV-120/60) REPAIR PACK (K74KKX-AC) See repair pack reference page 88

†Ratings in brackets are optional extended ratings; consult factory

NOTE: The above checked (✓) Valves, but with optional molded coils, are most popular based on sales and likely to be in Distributor stock.

SPECIFICATIONS—3-WAY DIRECTIONAL CONTROL

OPERATING CONDITIONS

Media: Air, water, and other fluids compatible with standard Buna seals. Hot water, steam gasoline, and many oils require special seal materials - Consult representative or factory. (Series 50 pressure ratings may change due to the viscosity of the liquid-consult factory for de-rating)

Valve Temperature Range: STANDARD VALVES – 0°F (-18°C) to 104°F (40°C) ambient; 0°F (-18°C) to 150°F (65°C) media. OPTIONAL VALVES – can tolerate much higher or much lower ambient and media temperatures. Consult factory for specifics.

Maximum Operating Pressure Differentials: See Catalog listings.

Burst Pressure: Series 20, 30, 50 - 5000 PSI Series 70 - 4000 PSI

Leakage: Bubble tight for standard valves

Vacuum: To 5 Microns - Consult factory

ELECTRICAL CHARACTERISTICS

Coil Voltage: Series 20 - 5 to 825 VAC 50-60 HZ. – 1.8 to 265V DC
Series 30 - 5.2 to 650 VAC 50-60 HZ. – 2 to 240V DC
Series 50 - 5.4 to 575 VAC 50-60 HZ. – 3.0 to 300V DC
Series 70 - 12 to 1050 VAC 50-60 HZ. – 2.5 to

220V DC

Nominal Power:

Series	D.C.	A.C.	Series	D.C.	A.C.
20	9.5	8.7 Watts	50	7.0	6.0 Watts
30	8.0	8.0 Watts	70	16.0	18.0 Watts

Coil Construction: Non-molded Class A, Molded and potted Class F. (Class H optional)

Typical Response Time on Air: 4 - 16 Milliseconds—all series

MECHANICAL CHARACTERISTICS

Body: Stainless steel (standard) - Ser. 20, 50, & 70
Brass (standard) - Ser. 30
Brass (optional) - Ser. 20, 50, & 70 - Consult factory
Aluminum (optional) - Ser. 50 - Consult factory

Orifice Diameter: See catalog listings

Porting: See catalog listings

Housing: Grommet & 1/2" NPT conduit - many options available.

Listings: Most valves are U.L. and CSA listed - Consult factory for specifics.

OPTIONS AVAILABLE: – 3 WAY DIRECTIONAL CONTROL

	D.C. 9.5 Watts

Coil Construction: Molded coil and third wire ground (standard)

Typical Response Time on Air: 4-16 Milliseconds

MECHANICAL CHARACTERISTICS

Body: Stainless steel

Orifice Diameter: See catalog listings

Porting: See catalog listings

Housing: 1/2" NPT conduit

Listings: Valves are U.L. Listed and CSA Certified for Hazardous Locations—Class I, Div 1, Group C and D - Class II, Div 1, Groups E, F, and G; Div 2 Groups A,B,C,D,E,F, and G.

°VALVES WITH 1/8 SLEEVE ORIFICE ARE NOT UL NOR CSA LISTED

† Ratings in brackets are optional extended ratings; consult factory

When ordering add voltage and frequency to complete valve number. Example: (E23GG7DCCM-120/60)

NOTE: The above checked (✓) Valves, but with optional molded coils, are most popular based on sales and likely to be in Distributor stock.

SPECIFICATIONS — 3-WAY EXPLOSION PROOF VALVES

OPERATING CONDITIONS

Media: Air, water, and other fluids, compatible with standard Buna seals.
Hot water, steam, gasoline, and many oils require special seal materials - Consult representative or factory.

Valve Temperature Range: 0°F (-18°C) to a maximum of 221°F (105°C) including coil heat rise, ambient and media temperatures. Other temperature ranges available on request—along with specific application parameter information specified.

Maximum Operating Pressure Differentials: See Catalog Listings

Burst Pressure: 5000 PSI

Leakage: Bubble tight for standard valves

Vacuum: To 5 Microns - Consult factory

ELECTRICAL CHARACTERISTICS

Coil Voltage: 5 to 825 VAC 50-60 HZ - 1.8 to 265V DC

Nominal Power:	Wattage
	A.C. 7.3 Watts
	D.C. 9.5 Watts

Coil Construction: Molded coil and third wire ground (standard)

Typical Response Time on Air: 4-16 Milliseconds

**PETER
PAUL**

SERIES 20 MODEL H21 & EH21

2-WAY NORMALLY OPEN HIGH PRESSURE

Model H21 with standard body

2-Way Normally Open

Coil Voltage: DC Only

Maximum Operating Pressure Differential: 2000 PSI (Gas or Liquid)

Orifice Size: .6 mm

CV Factor: .010

Filtration: Down to 60 microns or less is recommended

Burst Pressure: 5000 PSI

Valve Temperature Range: Standard Valves - 0°F (-18°C) to 104°F (40°C) ambient; 0°F (-18°C) to 150°F (65°C) media. Optional Valves - can tolerate much higher or much lower ambient and media temperatures. Consult factory for specifications.

EH21

EXCLUSIVE FEATURES INCLUDE:

A precision stainless steel **PLUNGER** that supplies the necessary impact force to energize valve.

A Kel-F® **PIN**† which functions as a sealing element, that is carefully machined for maximum concentricity and fine finish.

The **ORIFICE GUIDE** is one piece, for near perfect alignment. This means bubble-tight sealing from low pressures right up to maximum pressure rating with the bonus of longer life. The one piece Orifice/Guide can be pressed into almost any standard cavity making it available as an operator for special customer installations.

† Other pin materials available. consult factory

PATENTED

OTHER FEATURES INCLUDE:

Simple construction...

Only 2 moving parts

Available in both standard and explosion proof construction

1/8 or 1/4 NPT ports

PRINCIPLES OF OPERATION

When the valve coil is energized, the plunger is drawn towards the sleeve end stop. The plunger is allowed to accelerate freely for a short distance before it makes contact with the pin shoulder. Upon contact it imparts considerable force on the pin causing it to lift off the seat. A return spring provides the return force, directly on the pin, to seal the orifice when the coil is de-energized.

**PETER
PAUL**

SERIES 20 MODEL H23 & EH23 & H24 HIGH PRESSURE IMPACT TYPE DUAL OPERATOR SOLENOID VALVE

3-way media control at super-high pressure ratings

EH23

Series 20-Model H24 with single solenoid

3-Way Normally Open

Coil Voltage: DC Only

CV Factor Inlet: .010

CV Factor Exhaust: .024

Maximum Operating Pressure Differential:

1000 PSI (Gas or Liquid)

Orifice Size: .6 mm x 1/32"

Using the heart of the highly successful model H-22 valve, Peter Paul Electronics introduces a new dual operator valve that allows the same media control as a three way normally closed valve but at much higher pressure ratings than previously available.

†EXCLUSIVE FEATURES INCLUDE:

A precision stainless steel PLUNGER that supplies the necessary impact force to energize valve.

A Kel-F® PIN* which functions as a sealing element, that is carefully machined for maximum concentricity and fine finish.

The ORIFICE GUIDE is one piece, for near perfect alignment. This means bubble-tight sealing from low pressures right up to maximum pressure* rating with the bonus of longer life.

All internal connections are contained in the valve body. No need for sleeve adaptors or connecting tubes. All port connections are in the valve body.

† Other pin materials available. consult factory

PATENTED

To function as a 3-Way NC valve, operators must be alternately energized and de-energized. Pressure applied to "IN" Port must *always* be equal to or greater than the pressure in "CYL" Port

OTHER FEATURES INCLUDE:

Simple construction...

Only 2 moving parts per operator

Available in both standard and explosion proof construction

1/4 NPT ports

PRINCIPLES OF OPERATION

When the valve coil is energized, the plunger is drawn towards the sleeve end stop. The plunger is allowed to accelerate freely for a short distance before it makes contact with the pin shoulder. Upon contact it imparts considerable force on the pin causing it to lift off the seat. A return spring provides the return force, directly on the pin, to seal the orifice when the coil is de-energized.

Here is how it's done...

NOTE: ALL PORTS OPEN WHEN BOTH SOLENOIDS ENERGIZED
ALL PORTS CLOSED WHEN BOTH SOLENOIDS DE-ENERGIZED

OPTIONS AVAILABLE: – 3 WAY HI-PRESSURE VALVE

HOUSING OPTIONS see page 78

*STRAIN RELIEF CONNECTOR

* "AN" CONNECTOR

COIL OPTIONS – see page 79

MOLDED COIL

POTTED COIL & HOUSING

HIGH TEMPERATURE MOLDED COIL

SPECIFICATIONS

SERIES 20—MODEL H23

Three-way normally closed valve for high pressure applications. Valve must be mounted within 30° of vertical.

OPERATING CONDITIONS

†**Media:** Air and other non-corrosive gases, water and oil.

Valve Temperature Range: 0°F (-18°C) to a maximum of 221°F (105°C) including coil heat rise, ambient and media temperatures. Other temperature ranges available on request—along with specific application parameter information specified.

Burst Pressure: 5000 PSI

Maximum Operating Pressure Differential: to 3000 PSI

†To insure trouble free operation, filtration down to 60 microns or less is recommended.

Listings: Valves are U.L. Listed and CSA Certified for Hazardous Locations—Class I, Div 1, Group C and D - Class II, Div 1, Groups E, F, and G; Div 2 Groups A,B,C,D,E,F, and G.

ELECTRICAL CHARACTERISTICS

Coil Voltage: 5 to 825 VAC, 50-60 Hz. 1.8 to 265 VDC

Nominal Power: Wattage Per Operator

A.C. 7.3 watts

D.C. 9.5 watts

Coil Construction: Standard Valve—molded and non-molded
Explosion Proof valve—molded

Typical Response Time on Air: 4-16 milliseconds

MECHANICAL CHARACTERISTICS

Body: 300 Series Stainless Steel

†Aluminum Alloy-option available

Orifice Diameter: 1/32" - 3/32"

Porting: 1/4" NPT

Housing: Standard & Explosion Proof valves—1/2" NPT conduit

**PETER
PAUL**

SERIES 50 EW (5 WATTS AC & DC) MINIATURE HAZARDOUS LOCATION VALVES!

Meet today's demands for economy of space and energy consumption.

APPLICATION:

Peter Paul developed a UL approved, low watt, miniature hazardous location valve with minimal space and energy requirements in volatile environments. This valve is the smallest hazardous location solenoid, with the best ambient and high temperature ratings on the market. A NEMA 4 rating is standard. The Series 50 EW miniature valve with encapsulated coil also serves as a general purpose valve for pneumatic and hydraulic conditions.

SPECIFICATIONS—

OPERATING CONDITIONS

Media: Air and other fluids, compatible with standard Buna seals. Hot water, steam, gasoline, oils, some hydraulic fluids, and many other media require special seal materials - Consult representative of factory.

Valve Temperature Range: Standard Valves - 0°F (-18°C) to 140°F (60°C) ambient; 0°F (-18°C) to 150°F (60°C) media. Optional Valves - can tolerate much higher or much lower ambient and media temperatures. Consult factory for specifications.

Maximum Operating Pressure Differentials: See catalog listings

Burst Pressure: 5000 PSI

Leakage: Bubble tight for standard valves

Vacuum: To 5 Microns - Consult factory

ELECTRICAL CHARACTERISTICS

Coil Voltage: 24 to 277 VAC 50-60 HZ.-6 to 200 VDC. All standard voltages (U.S. & Export) carried in stock. Special voltages readily produced on order.

Nominal Power: **Series 50**

EW 5.0 watts AC and DC

Coil Construction: Standard, Molded with 24" leads.

Typical Response Time on Air: 4-16 Milliseconds

Operating Speed: Up to 600 CPM

Duty Cycle: Continuous or Intermittent

MECHANICAL CHARACTERISTICS

Material: All interior parts are stainless steel

Orifice Diameter: See catalog listings

Porting: 1/8 NPT

Housing: Encapsulated construction with 1/2 NPT conduit connection and third wire ground.

Listings: Valves are U.L. Listed for Hazardous Locations—Class I, Div 1, Groups A, B, C and D - Class II, Div 1 Groups E, F, and G; Div 2 Groups A, B, C, D, E, F and G. "T" Rating as low as T4

Life expectancy: Millions of cycles, depending on application, lubrication, etc.

Valve Weight: Only .60 lbs average

Repair Packs: Consult Factory

SERIES E50 MINIATURE EXPLOSION PROOF VALVES!

Meet today's demands for economy of space and energy consumption.
For hazardous locations.

APPLICATION:

General purpose or safety valves for pneumatic and hydraulic applications. The versatility of these valves is increased to include the handling of hot air, hot water, refrigerants and many other media, by the use of different seals.

SPECIFICATIONS—

OPERATING CONDITIONS

Media: Air and other fluids, compatible with standard Buna seals. Hot water, steam, gasoline, oils, some hydraulic fluids, and many other media require special seal materials - Consult representative or factory.

Valve Temperature Range: Standard Valves - 0°F (-18°C) to 104°F (40°C) ambient; 0°F (-18°C) to 150°F (65°C) media. Optional Valves - can tolerate much higher or much lower ambient and media temperatures. Consult factory for specifications.

Maximum Operating Pressure Differentials: See catalog listings

Burst Pressure: 5000 PSI

Leakage: Bubble tight for standard valves

Vacuum: To 5 Microns - Consult factory

ELECTRICAL CHARACTERISTICS

Coil Voltage: 5.4 to 575 VAC 50-60 HZ. —3.0 to 300 VDC. All standard voltages (U.S. & Export) carried in stock. Special voltages readily produced on order.

Nominal Power:

	A.C. VALVES		
	2 WNC	3 Way & 2 WNO	
D.C. Valves	Valves	Valves	
7.2 Watts	4.0 Watts	5.6 Watts	

Coil Construction: Standard, Molded with 24" leads. For Non-molded construction consult Factory.

Typical Response Time on Air: 4-16 Milliseconds

Operating Speed: Up to 600 CPM

Duty Cycle: Continuous or Intermittent

MECHANICAL CHARACTERISTICS

Material: All interior parts are stainless steel

Orifice Diameter: See catalog listings

Porting: 1/8 NPT

Housing: Explosionproof construction with 1/2 NPT conduit connection and third wire ground.

Available in stainless steel (consult factory)

Listings: Valves are U.L. Listed and CSA Certified for Hazardous Locations—Class I, Div 1, Group C and D - Class II, Div 1, Groups E, F, and G; Div 2 Groups A,B,C,D,E,F, and G.

Life expectancy: Millions of cycles, depending on application, lubrication, etc.

Valve Weight: Only .65 lbs average

Repair Packs: Consult Factory

OPTIONS: Also available in all stainless steel construction

Metering, bottom orifice or cavity porting, manifold mount, built in muffler, universal mounting bracket, potted coil, Class H molded coil.

SERIES EL 50 MINIATURE EXPLOSION PROOF VALVES (1.8 WATTS AC AND DC) SERIES ELL50 MINIATURE EXPLOSION PROOF VALVES (.85 WATTS DC)

Meet today's demands for economy of space and energy consumption. For hazardous locations.

APPLICATION:

General purpose or safety valves for pneumatic and hydraulic applications. The versatility of these valves is increased to include the handling of hot air, hot water, refrigerants and many other media, by the use of different inserts.

SPECIFICATIONS—

OPERATING CONDITIONS

Media: Air and other common gases, common refrigerants except ammonia, city gas supplied by public utilities, Nos. 1 and 2 fuel oils, oils having viscosities not more than 40, SU at 100° F, steam, some hydraulic and water or other aqueous non-flammable liquids. Some media require special seal material - Consult Factory.

Valve Temperature Range: Standard Valves - 0°F (-18°C) to 104°F (40°C) ambient; 0°F (-18°C) to 150°F (65°C) media. Optional Valves - can tolerate much higher or much lower ambient and media temperatures. Consult factory for specifications.

Maximum Operating Pressure Differentials: See table listings

Burst Pressure: 4000 PSI

Leakage: Bubble tight for standard valves

Vacuum: To 5 Microns - Consult factory

ELECTRICAL CHARACTERISTICS

Coil Voltage: 5-120 V DC 12-240 V 60HZ. All standard voltages carried in stock. Other voltages readily produced on order.

Nominal Power:

EL50 1.8 watts AC and DC

ELL50 .85 watts DC

Coil Construction: Nonmolded coil, Molded with 24" leads. Molded coil potted inside housing. ALSO MOLDED CLASS H COIL.

Typical Response Time on Air: 4-16 Milliseconds

Operating Speed: Up to 600 CPM

Duty Cycle: Continuous or Intermittent

MECHANICAL CHARACTERISTICS

Material: All interior parts are stainless steel

Orifice Diameter: See table listings

Porting: 1/8 PTF
1/8 NPT - available (consult factory)

Housing: Explosionproof construction with 1/2 NPT conduit connection.
Available in stainless steel (consult factory)

Listings: Valves are U.L. Listed and CSA Certified for Hazardous Locations—Class I, Div 1, Group C and D - Class II, Div 1, Groups E, F, and G; Div 2 Groups A,B,C,D,E,F, and G.

Life expectancy: Millions of cycles, depending on application, lubrication, etc.

Valve Weight: Only .65 lbs average

Repair Packs: Consult Factory

OPTIONS:

Metering, bottom orifice or cavity porting, built in muffler, universal mounting bracket, potted coil, Class H molded coil. Third wire ground available on request.

FOR FLOW CHARTS SEE PAGES 95-97

SERIES 50 ELW (1.8 WATTS AC & DC) SERIES 50 ELLW (.50 WATTS DC) MINIATURE HAZARDOUS LOCATION VALVES!

Meet today's demands for economy of space and energy consumption.

APPLICATION:

Peter Paul developed a UL approved, low watt, miniature hazardous location valve with minimal space and energy requirements in volatile environments. This valve is the smallest hazardous location solenoid, with the best ambient and high temperature ratings on the market. A NEMA 4 rating is standard. The Series 50 ELW miniature valve with encapsulated coil also serves as a general purpose valve for pneumatic and hydraulic conditions.

SPECIFICATIONS—

OPERATING CONDITIONS

Media: Air and other fluids, compatible with standard Buna seals. Hot water, steam, gasoline, oils, some hydraulic fluids, and many other media require special seal materials - Consult representative of factory.

Valve Temperature Range: Standard Valves - 0°F (-18°C) to 140°F (60°C) ambient; 0°F (-18°C) to 150°F (60°C) media. Optional Valves - can tolerate much higher or much lower ambient and media temperatures. Consult factory for specifications.

Maximum Operating Pressure Differentials: See catalog listings

Burst Pressure: 5000 PSI

Leakage: Bubble tight for standard valves

Vacuum: To 5 Microns - Consult factory

ELECTRICAL CHARACTERISTICS

Coil Voltage: 24 to 277 VAC 50-60 HZ.-6 to 120 VDC. All standard voltages (U.S. & Export) carried in stock. Special voltages readily produced on order.

Nominal Power: **Series 50**

ELW 1.8 watts AC and DC

ELLW .50 watts DC only

Coil Construction: Standard, Molded with 24" leads.

Typical Response Time on Air: 4-16 Milliseconds

Operating Speed: Up to 600 CPM

Duty Cycle: Continuous or Intermittent

MECHANICAL CHARACTERISTICS

Material: All interior parts are stainless steel

Orifice Diameter: See catalog listings

Porting: 1/8 NPT

Housing: Encapsulated construction with 1/2 NPT conduit connection and third wire ground.

Listings: Valves are U.L. Listed for Hazardous Locations—Class I, Div 1, Groups A, B, C and D - Class II, Div 1 Groups E, F, and G; Div 2 Groups A, B, C, D, E, F and G. "T" Rating as low as T5

Life expectancy: Millions of cycles, depending on application, lubrication, etc.

Valve Weight: Only .60 lbs average

Repair Packs: Consult Factory

FOR FLOW CHARTS SEE PAGES 95-97

SERIES 50 SUPER LOW WATT (SLW) (1.8 WATTS AC & DC) SERIES 50 SUPER LOW LOW WATT (SLLW) (.50 WATTS DC)

Meet today's demands for economy of space and energy consumption.

APPLICATION:

General purpose or safety valves for pneumatic and hydraulic applications. The versatility of these valves is increased to include the handling of hot air, hot water, refrigerants and many other media, by the use of different Seals.

Note: The SLLW Valve is not a safety valve.

SPECIFICATIONS—

OPERATING CONDITIONS

Media: Air and other fluids, compatible with standard Buna seals. Hot water, steam, gasoline, oils, some hydraulic fluids, and many other media require special seal materials - Consult representative of factory.

Valve Temperature Range: Standard Valves - 0°F (-18°C) to 140°F (60°C) ambient; 0°F (-18°C) to 150°F (65°C) media. Optional Valves - can tolerate much higher or much lower ambient and media temperatures. Consult factory for specifications.

Maximum Operating Pressure Differentials: See catalog listings

Burst Pressure: 5000 PSI

Leakage: Bubble tight for standard valves

Vacuum: To 5 Microns - Consult factory

ELECTRICAL CHARACTERISTICS

Coil Voltage: 24 to 277 VAC 50-60 HZ.—6 to 120 VDC. All standard voltages (U.S. & Export) carried in stock. Special voltages readily produced on order.

Nominal Power: **Series 50**

SLW 1.8 watts AC and DC

SLLW .50 watts DC only

Coil Construction: Standard, Molded with 24" leads.

Typical Response Time on Air: 4-16 Milliseconds

Operating Speed: Up to 600 CPM

Duty Cycle: Continuous or Intermittent

MECHANICAL CHARACTERISTICS

Material: All interior parts are stainless steel

Orifice Diameter: See catalog listings

Porting: 1/8 NPT

Housing: 1/2 NPT conduit connection and third wire ground.

Life expectancy: Millions of cycles, depending on application, lubrication, etc.

Valve Weight: Only .60 lbs average

OPTIONS: Metering, bottom orifice or cavity porting, manifold mount, built in muffler, universal mounting bracket, potted coil.

FOR FLOW CHARTS SEE PAGES 95-97

SERIES 50 LOW WATT (LW 2.5 WATTS AC AND DC) SERIES 50 LOW LOW WATT (LLW 0.65 WATTS DC)

APPLICATION:

General purpose or safety valves for pneumatic and hydraulic applications. The versatility of these valves is increased to include the handling of hot air, hot water, refrigerants and many other media, by the use of different Seals.

Note: The LLW Valve is not a safety valve.

SPECIFICATIONS—

OPERATING CONDITIONS

Media: Air and other fluids, compatible with standard Buna seals. Hot water, steam, gasoline, oils, some hydraulic fluids, and many other media require special seal materials - Consult representative of factory.

Valve Temperature Range: Standard Valves - 0°F (-18°C) to 104°F (40°C) ambient; 0°F (-18°C) to 150°F (65°C) media. Optional Valves - can tolerate much higher or much lower ambient and media temperatures. Consult factory for specifications.

Maximum Operating Pressure Differentials: See catalog listings

Burst Pressure: 5000 PSI

Leakage: Bubble tight for standard valves

Vacuum: To 5 Microns - Consult factory

ELECTRICAL CHARACTERISTICS

Coil Voltage: 24 to 277 VAC 50-60 HZ.—6 to 120 VDC. All standard voltages (U.S. & Export) carried in stock. Special voltages readily produced on order.

Nominal Power: **Series 50**

LW 2.5 watts AC and DC

LLW 0.65 watts DC only

Coil Construction: Standard, Molded with 24" leads. For Non-molded construction consult Factory.

Typical Response Time on Air: 4-16 Milliseconds

Operating Speed: Up to 600 CPM

Duty Cycle: Continuous or Intermittent

MECHANICAL CHARACTERISTICS

Material: All interior parts are stainless steel

Orifice Diameter: See catalog listings

Porting: 1/8, NPT

Housing: Grommet & 1/2 NPT conduit - many options available.

Life expectancy: Millions of cycles, depending on application, lubrication, etc.

Valve Weight: Only .40 lbs average

OPTIONS: Metering, bottom orifice or cavity porting, manifold mount, built in muffler, universal mounting bracket, potted coil.

FOR FLOW CHARTS SEE PAGES 95-97

SERIES S58 Up-rated Pressure Sub-Miniature Valves (3.5 watts)

Meet today's demands for economy of space and energy consumption.

APPLICATION:

The Series S58 can be easily interfaced with circuit boards and miniaturized components. The versatility is for connecting electronic signals to pneumatic outputs. The small size is ideal for stand alone (with #10-32 ports) or multiple valves mounted on one manifold. May be used to "pilot" larger valves. These valves are ideal for micro electronic production equipment and medical or chemical analytical applications and can operate directly from most programmable controllers.

SPECIFICATIONS—

OPERATING CONDITIONS

Media: Air and other common gasses - filtration recommended - 30 microns or less.

Valve Temperature Range: Standard Valves - 5°F (– 15°C) to 122° F (50° C) ambient; media. Optional valves.

Maximum Operating Pressure Differentials: See catalog listings

Burst Pressure: 1500 PSI

Leakage: Bubble tight for standard valves

Vacuum: To 5 Microns - Consult factory

Coil Voltage: 6 to 220 VAC 50-60 HZ.— 2 to 150 VDC. All standard voltages (U.S. & Export) carried in stock. Special voltages readily produced on order.

ELECTRICAL CHARACTERISTICS

Nominal Power:	Series	Watts
	S58	3.5

Coil Construction: Molded

Typical Response Time on Air: AC - 3 TO 9 ms. DC - 9 ms.

Duty Cycle: Continuous

MECHANICAL CHARACTERISTICS

Material: Moving parts - stainless steel
Body - stainless steel or brass
Seals - Nitrile (Buna N) Standard. FKM EPDM ® Optional.

Orifice Diameter: See catalog listings

Porting: 10-32 Thd., stud mount

Housing: Metal Housing with flying leads

Life expectancy: Millions of cycles, depending on application, lubrication, etc.

Valve Weight: 2 3/4 oz

Repair Packs: Consult factory

Options: Stainless Steel or Brass Body
Stainless Steel or Brass 10-32 Thd. Stud Mount.

SERIES 58 Low Watt Sub-Miniature Valves (3.5 WATTS)

SERIES L58 Low Watt Sub-Miniature Valves (0.9 WATTS)

Meet today's demands for economy of space and energy consumption.

APPLICATION:

The Series 58 can be easily interfaced with circuit boards and miniaturized components. The versatility is for connecting electronic signals to pneumatic outputs. The small size is ideal for stand alone (with #10-32 ports) or multiple valves mounted on one manifold. May be used to "pilot" larger valves. These valves are ideal for micro electronic production equipment and medical or chemical analytical applications and can operate directly from most programmable controllers.

SPECIFICATIONS—

OPERATING CONDITIONS

Media: Air and other common gasses - filtration recommended 30 microns or less.

Valve Temperature Range: Standard Valves - 5°F (-15°C) to 122°F (50°C) ambient; media.

Maximum Operating Pressure Differentials: See catalog listings

Burst Pressure: 1500 PSI

Leakage: Bubble tight for standard valves

Vacuum: To 5 Microns - Consult factory

Coil Voltage: 6 to 220 VAC 50-60 Hz. - 2 to 150V DC. All standard voltages (U.S. & Export) carried in stock. Special voltages readily produced on order.

ELECTRICAL CHARACTERISTICS

Nominal Power:	Series	Watts
Table A	58	3.5
Table B	L58	0.9

Coil Construction: Molded

Typical Response Time on Air: AC - 3 TO 9 ms. DC - 9 ms.

Duty Cycle: Continuous or intermittent

MECHANICAL CHARACTERISTICS

Material: Moving parts - stainless steel
Body - Plastic
Seals - Nitrile (Buna N) Standard. FKM or EPDM® Optional.

Orifice Diameter: See catalog listings

Porting: 10-32 Thd., Stud Mount, Manifold Mount

Life expectancy: Millions of cycles, depending on application, lubrication, etc.

Valve Weight: Approximately 2 oz.

Repair Packs: Consult factory.

Options: Stainless Steel or Brass Body
Stainless Steel or Brass 10-32 Thd. Stud Mount

FOR FLOW CHARTS SEE PAGES 95-97
For Numbering system chart see page 105

MINIATURE SOLENOID VALVE OPERATORS

A complete line of valve operators for O.E.M. applications are offered for those who wish to incorporate them in their own product line. Full technical information and details are available from Peter Paul.

SERIES 40 PLASTIC VALVES (3.3 WATTS AC AND 5 WATTS DC)

APPLICATION:

General purpose valves are engineered for competitive cost and reliable service in humidifiers, pneumatic actuation systems, beverage dispensers and other equipment.

SPECIFICATIONS—

OPERATING CONDITIONS

Media: The valves may be used with air, inert gas and liquid media.

Valve Temperature Range: Standard Valves - 0°F (-18°C) to 104°F (40°C) ambient; 0°F (-18°C) to 150°F (60°C) media. Optional Valves - can tolerate much higher or much lower ambient and media temperatures. Consult factory for specifications.

Maximum Operating Pressure Differentials: See catalog listings

Burst Pressure: 1000 PSI

Leakage: Bubble tight for standard valves

Vacuum: To 5 Microns - Consult factory

ELECTRICAL CHARACTERISTICS

Coil Voltage: 24 to 277 VAC 50-60 HZ.—6 to 120 VDC. All standard voltages (U.S. & Export) carried in stock. Special voltages readily produced on order.

Nominal Power:	D.C. VALVES	A.C. VALVES
	5 Watts	3.3 watts

Coil Construction: Standard, Molded with 24" leads.

Typical Response Time on Air: 4-16 Milliseconds

Operating Speed: Up to 600 CPM

Duty Cycle: Continuous or Intermittent

MECHANICAL CHARACTERISTICS

Material: All interior parts are stainless steel and, acetal and PET.

Orifice Diameter: See catalog listings

Porting: 1/8 NPT

Life expectancy: Millions of cycles, depending on application, lubrication, etc.

Valve Weight: Only .27 (14 1/2 oz.) lbs average

Repair Packs: Consult Factory

SERIES 80 LARGE ORIFICE TWO WAY DIAPHRAGM VALVES

NEW! Up to 3" NPT and stainless steel bodies available. Consult factory.

SERIES 80 Valves for general applications are available **normally closed** or **normally open**.

Models 818 and 828 are solenoid operated diaphragm valves that use a differential pressure principal. (Internal Pilot).

Model 827 is a solenoid operated diaphragm valve that can operate at low pressures without any differential pressure across the diaphragm (Direct Lift).

The 80 Series has been designed for high flow applications—large ½" diameter orifice. 80 Series valves are constructed with the same quality materials and workmanship as the smaller Peter Paul Valves. Bodies are made of strong brass forgings.

Internal metal parts are stainless steel. Seals are made from Nitrile Rubber (Buna N). Other materials can be provided for special applications.

80 Series valves can be used with most common media—water—air—oil—etc.

80 Series valves use the same coils and housings as Peter Paul's popular 20 Series valves, therefore, the same wide range of voltages and variations in coil construction and housing configurations are available.

Nominal Power Consumption

D.C.—9.5 Watts A.C.—7.7 Watts (Typical)

Valve Temperature Range: STANDARD VALVES — 0°F (-18°C) to 104°F (40°C) ambient; 0°F (-18°C) to 150°F (65°C) media.

OPTIONAL VALVES — can tolerate much higher or much lower ambient and media temperatures. Consult factory for specifics.

828 LARGE ORIFICE VALVE WITH SOLID STATE TIMER

In many applications timing is everything

The 828 2 way normally closed valve is particularly suited to applications like draining condensation in compressed air systems. The timer provides the versatility needed for this function. The 828 integrated timer/valve creates opportunities for hundreds of applications.

80 Series valves are constructed with the same quality materials and workmanship as the smaller Peter Paul Valves. Bodies are made of strong brass forgings. Internal metal parts are stainless steel. Seals are made from Nitrile Rubber (Buna N). Other materials can be provided for special applications. 80 Series valves can be used with most common media—water—air—oil—etc.

80 Series valves use the same coils and housings as Peter Paul's popular 20 Series valves, therefore, the same wide range of voltages, variations in coil construction and housing configurations are available.

For OTHER VALVES and VALVE CONFIGURATIONS WITH TIMERS – consult PETER PAUL.
(This timer can be used with series "20" and "30" valves.)

SPECIFICATIONS

PRESSURE 5-150 PSI **VOLTAGE** 120/60 110/50 240 A.C.

PIPE SIZE 1/2 NPT (in line) – **ORIFICE** 5/8"

NOMINAL POWER CONSUMPTION 9.5 Watts

LINE CORD 6 Ft. w/ Standard Three Prong Plug

TIMER ADJUSTMENT:

Off Time 1 to 45 min. **On Time** .25 sec. to 25 sec.

PUSH BUTTON MANUAL OVERRIDE

STATUS LIGHTS to show power and operation.

Timer and coil may be rotated 360°

TIMER FUNCTION

Upon application of power to the input terminals, the off cycle is initiated. At the end of the pre-set off time, the solenoid is energized and the on cycle begins. At the end of the preset on time, power is removed from the solenoid and a new cycle begins. Cycling continues until power is removed from the input terminals.

SPECIAL APPLICATIONS

Series 30 - Model F32 - Filter Valve

SPECIFICATIONS - OPERATING CONDITIONS

Media: Air, water.

Valve Temperature Range: STANDARD VALVES – 0°F (-18°C) to 104°F (40°C) ambient; 0°F (-18°C) to 150°F (65°C) media.
OPTIONAL VALVES – can tolerate much higher or much lower ambient and media temperatures.
Consult factory for specifics.

Burst Pressure: Series 30 - 4000 PSI

Leakage: Bubble tight

ELECTRICAL CHARACTERISTICS

Coil Voltage: 5 to 650 VAC 50-60 HZ – 2 to 240 V DC

Nominal Power: 9 Watts AC & DC

Coil Construction: Molded and Non-Molded.

Typical Response Time on Air: 4-16 Milliseconds

Series 50 - Media Isolation Valve

Meet today's demands for economy of space and energy consumption.

APPLICATION:

Compact, Series 50 solenoid valves are now configured with molded nylon valve bodies and custom porting which isolate potentially corrosive media from the valve operator for applications in the medical, instrumentation, chemical, and food processing industries. These 2-way normally closed valves, are available for both continuous and intermittent duty, based on the back pressure encountered in operation.

SPECIFICATIONS - OPERATING CONDITIONS

Type: 2-Way Normally Closed

Media: Liquids compatible with Nylon and Nitrile (Gas, possible)

Maximum Inlet Pressure: 50 PSI

Power: 4.25 Watts AC, 7.25 Watts DC

Electrical Connections: 1/4" Spade Terminals

Back Pressure: 5 PSI Maximum

Fluid Connections: Inlet – 1/8 NPT Female Port (Side)
Outlet – 1/8 NPT Male Port (Bottom)

Orifice: 3/64"

Flow: $C_v = 0.037$

Mounting Position: Vertical Recommended

Coil: Molded – Class A (can be rotated 360°)

Voltages: All common AC and DC Voltages

Options: Silicone or EPDM Diaphragms Available

INTERMITTENT DUTY

Maximum Inlet Pressure: 35 PSI

Voltage: All common DC Voltages

Power: 17 Watts DC

Duty Cycle: 0.167 Minutes ON Max.
0.833 Minutes OFF Min.

WATER FLOW

**PETER
PAUL**

SERIES 20 Magnetic Latching Valve

Meet today's demands for economy of space and energy consumption.

APPLICATION:

This type of valve is often used in remote areas where continuous power may not be available or with battery-powered portable equipment where power capacity is limited. It is also valuable in equipment where coil heating, due to continuous applications of power, is undesirable such as in medical and chemical analyzers, etc.

SPECIFICATIONS—

OPERATING CONDITIONS

Media: Air and other fluids, compatible with standard Buna seals. Hot water, steam, gasoline, oils, some hydraulic fluids, and many other media require special seal materials - Consult representative of factory.

Valve Temperature Range: Standard Valves - 0°F (-18°C) to 104°F (40°C) ambient; 0°F (-18°C) to 150°F (65°C) media. Optional Valves - can tolerate much higher or much lower ambient and media temperatures. Consult factory for specifications.

Maximum Operating Pressure Differentials: See catalog listings

Burst Pressure: 5000 PSI

Leakage: Bubble tight for standard valves

Vacuum: To 5 Microns - Consult factory

ELECTRICAL CHARACTERISTICS

Coil Voltage: 6 to 60 VDC. All standard voltages (U.S. & Export) carried in stock. Special voltages readily produced on order.

Nominal Power: 10 watts

Typical Response Time on Air: Approximate 30 millisecond pulse to energize
Approximate 30 millisecond pulse to de-energize

Operating Speed: Up to 60 CPM

Duty Cycle: Continuous

MECHANICAL CHARACTERISTICS

Material: All interior parts are stainless steel

Orifice Diameter: See catalog listings

Porting: See catalog listings

Housing: European style DIN COIL for your convenience we have the female DIN style mating connector No. 20-198** available for an additional fee.

Life expectancy: Millions of cycles, depending on application, lubrication, etc.

Valve Weight: 1.2 lbs lbs average

Repair Packs: Consult Factory

Metering, bottom orifice or cavity porting, manifold mount, built in muffler, universal mounting bracker, brass body.

FOR FLOW CHARTS SEE PAGES 95-97

Extended pressure rating available. Consult factory.

SERIES O20

For two and three-way OEM applications. Peter Paul offers a complete line of operators to control most media. Available up to 1/4" orifice. Consult factory for technical data and detail prints.

SERIES OE20

EXPLOSION PROOF SOLENOID OPERATORS

For two and three-way OEM application Peter Paul's unique, unitized design offers the advantages of simplicity of installation (unit is assembled and tested requiring no disassembly) for common voltages and frequencies and carries the U.L. and C.S.A. label. Approved for hazardous locations, Class I — Groups C and D (where atmosphere contains certain specific explosive gases). Class II — Group E (where atmosphere contains metallic dust). F (where atmosphere contains non-metallic combustible dust). And Group G (where atmosphere contains grain dust).

SERIES OH20

For 2WNC applications where high pressures are used—or where inert seals are required with bubble-tight sealing. Operator and precision press-in seat must be installed to factory specs. Consult factory for technical data and detail prints.

SERIES OEH20

For 2WNC applications where explosion-proof operators are required with high pressure ratings or inert seal requirement with bubble-tight sealing. Operator and precision press-in seat must be installed to factory specs. Consult factory for technical data and detail prints.

SERIES O30

For two-way and three-way OEM applications. Peter Paul offers a complete line of operators to control most media. Available up to 3/16" orifice. Consult factory for technical data and detail prints.

SERIES O50

For two-way and three-way OEM applications. Peter Paul offers a complete line of miniature operators to control most media. Available up to 1/8" orifice. Consult factory for technical data and detail prints.

SERIES OE50

For two and three-way OEM application Peter Paul's unique, unitized design offers the advantages of simplicity of installation (unit is assembled and tested requiring no disassembly) for common voltages and frequencies and carries the U.L. and C.S.A. label. Approved for hazardous locations, Class I — Groups C and D (where atmosphere contains certain specific explosive gases). Class II — Group E (where atmosphere contains metallic dust). F (where atmosphere contains non-metallic combustible dust). And Group G (where atmosphere contains grain dust).

SERIES O70

For two-way and three-way OEM applications. Peter Paul offers a complete line of large capacity operators to control most media. Available up to 1/4" orifice. Consult factory for technical data and detail prints.

SERIES O15

For two-way and three-way OEM applications. Peter Paul offers a complete line of miniature operators to control most media. Available up to 3/32" orifices. This line's unique design incorporates the coil and magnetic structure encapsulated completely in molded epoxy. Consult factory for technical data and detail drawing of cavity machining dimensions.

SERIES OELW

For two-way and three-way OEM applications. Peter Paul offers a complete line of miniature operators to control most media. Available up to 1/8" orifice. Consult factory for technical data and detail prints.

PETER PAUL VALVE TYPES — 2-WAY NORMALLY OPEN • 2-WAY NORMALLY CLOSED • 3-WAY NORMALLY OPEN • 3-WAY NORMALLY CLOSED EXHAUST TO ATMOSPHERE • 3-WAY NORMALLY CLOSED PIPE EXHAUST • 3-WAY DIRECTIONAL CONTROL • 3-WAY MULTI PURPOSE

SPECIALTY VALVES — A few of the many valve variations for custom or special purpose. We are prepared to make unusual valves available easily at any time.

Broad Range of Solenoid Valve Manifolds

Typical of the standard and custom brass, aluminum, and stainless steel manifolds and stacking bodies we produce are (clockwise from 6) anodized aluminum modular stacking bodies with a variety of valve housings and common tie rod; anodized aluminum 2-station manifold with Series 50 conduit valves; 4-station manifold with Series 50 grommet valves; stainless steel 8-station directional control valve with Series 30 conduit valves; special 2-station aluminum block with Series 20 spade terminal coils; brass 3-station manifold with Series 15 DIN style connectors; brass manifold with 2-way NC Series 30 grommet valves; and 6-station anodized aluminum manifold with Series 50 yoke/spade terminal coils.

Standard, conventional, one-piece machined stainless steel, aluminum, or optional brass solenoid valve manifolds allow the economical, low profile grouping of valves in compact arrays. Like any other purpose-designed, machined component, these manifolds are perfect for fixed, continuous operations such as beverage dispensing. They are configurationally inflexible.

In an effort to solve these problems while retaining the simplicity and convenience of standard solenoid valve manifolds, we developed a line of modular, stainless steel and anodized aluminum stacking valve bodies linked together with common tie rods. For horizontal or vertical mounting, these stacking bodies simplify in-the-field solenoid valve addition or replacement and accommodate models from Peter Paul standard Series 50 and 15 valve series. These manifold building blocks simplify both OEM and user inventories; custom manifolds can be constructed using a variety of solenoid valve types in linear arrays. Each modular valve body is precision machined, drilled, and tapped just as complete manifolds are. The basic difference is that they are linked together by common threaded tie rods, with modules sealed from each other with O-rings, and sandwiched, as a group, together with precision machined end caps. The result is a unique and proprietary method for creating and altering groupings of solenoid valves while maintaining the significantly reduced potential for leakage and thread damage for which one-piece manifolds were originally designed.

Easily Mounted Screw-In Solenoid Valve Bodies Now Offered

We now produce new, brass, screw-in solenoid valve bodies offering simplified assembly, disassembly, and field replacement.

Our new screw-in valve bodies speed and simplify valve-to-manifold attachments. To help eliminate leakage and provide the required high burst pressure ratings, brass valve bodies are offered with 1/8" NPT and 1/4" NPT male ports, currently in our Series 50 valves. The standard ports also make the manifolds easier to produce, with one center drill connecting all the valves.

Our new brass, screw-in solenoid valve bodies with 1/8" NPT or 1/4" NPT male ports simplify valve-to-manifold attachment and manifold production. Shown here is a diagram of a four-station manifold, to which brass bodies with 1/8" NPT ports have been manually attached. Two brass bodies with 1/8" or 1/4" NPT male ports are shown in the foreground.

Special Valve For CFC Recovery

These are some basic valve and manifold combinations we're providing to the refrigerant recovery/recycle equipment market, including Series 50 and Series 20 (center and lower right) valves. Our built-in back pressure design on some models gives us a leg up by helping to eliminate possible refrigerant leakage to atmosphere during HVACR system servicing.

Specifications: The Most Common Peter Paul Solenoid Valves For Refrigerant Applications

	Series 20 With Back Pressure	Series 20 Without Back Pressure	Series 50
Valve Type	2-Way Normally Closed	2-Way Normally Closed	2-Way Normally Closed
Orifice Size	5/64	5/64	1/16 or 5/64
Voltage	Any AC or DC voltage	Any AC or DC voltage	5/64: Any AC or DC voltage 1/16: AC or DC voltage
Inlet Pressure	280 psi maximum	300 psi maximum	300 psi maximum
Back Pressure	150 psi maximum	none	none
Power Consumption	12 Watts AC; 9.5 Watts DC	12 Watts AC; 9.5 Watts DC	6.6 Watts AC; 7 Watts DC
Electrical Connections	Spade terminals	Spade terminals	Spade terminals
Body Connections	1/8 NPT pipe ports or copper (sweat) tubing	1/8 NPT pipe ports or copper (sweat) tubing	1/8 NPT pipe ports or manifold mounting
Seals	Neoprene®	Neoprene®	Neoprene®

Stacking Valve Bodies

The Peter Paul manifold configuration involving stacking valve bodies held together with threaded tie rods is designed for multiple solenoid valve operation and greater flow capacity. Utilizing a standard mounting "footprint" for either common cavity or common orifice, these modular manifolds allow the use of either type within the same manifold. Most importantly, the common flow path through the manifold has been increased almost 700% providing unrestricted flow for quicker response times.

This do-it-yourself building block manifold is widely used in the emission analyzer and gas processing fields. The new style modules are 90% machined and drilled from bar stock. Each module can be in a center or end position in the manifold. A common, pre-drilled port connects all modules in the stack: the finish drilling of each valve module determines the flow pattern through the manifold. It is now possible to mix and match these valve bodies with only minor drilling operations to meet an individual user's application requirements.

Type Available:	Grommet, Conduit, Spade Terminal or DIN Type
Coil Options:	Molded and Non-molded
Series Available:	15 & 50
Orifice Sizes:	Refer to Series 15 or 50
Porting:	1/8" NPT
Pressure Rating:	Refer to Series 15 or 50

Stacking valve bodies for Series 15 and 50 solenoid valves consist of passivated 303 stainless steel or anodized aluminum bodies. These components can be assembled in either outboard or center locations within the modular manifold using threaded tie rods.

Food-Grade Valve Applications

Our new NSF approvals allow most of our complete product line to be used in food grade applications, including Series 15, 20, 30, 50 and Series 70 valves. Consult factory.

NSF criteria C-2 covers sanitation requirements for equipment and/or devices used in storing, preparing, or handling foods and beverages. FDA guidelines are for non-metallic material that comes in contact with food-type media. The seal materials that meet FDA's requirements are FLUOREL and SANTOPRENE®. Fluorel is used where higher temperatures exist.

NSF approvals have been received for the Series 15, 20, 30, 50 and Series 70 valves.

Making Kalrez® Seals Affordable For Volume Valve Applications

We have developed a new and significant cost saving procedure for laser cutting Kalrez® seals from sheet stock for solenoid valve plunger assemblies. Previously (and difficultly) molded seals requiring more than double the amount of Kalrez have now been replaced by a Kalrez seal disc and stainless steel seal cup which are press fit into the plunger. Shown here, clockwise from left, are the new seal cup, seal, and plunger; a Series 52 solenoid valve plunger assembly complete; and a typical molded Kalrez seal from a previous solenoid valve design.

Kalrez® Perfluoroelastomer seals, a product of DuPont Dow Elastomers, are impervious to more than 1,600 chemicals and solvents, inert to most chemically induced swelling, useful in temperatures from -20°F to 600°F, and last much longer than other elastomer seals. Kalrez is also a very expensive design material, even in medical and chemical resistant applications for which no other seal material is nearly as durable.

We have been using Kalrez for solenoid valve plunger seals in applications where nothing else would do. These molded Kalrez seals often more than doubled the price of comparable valves incorporating other elastomer seals.

We have developed a procedure for laser cutting Kalrez seals from 3" square sheet stock. We've now been able to cut the amount of Kalrez used per seal by about half, reducing the cost per seal, even in relatively small quantities, by about 40-60%." Currently limited to 3/32" and smaller orifice sizes, the valve plunger assembly has been slightly modified to use a stainless steel seal cup to attach the Kalrez seal to the plunger. The use of the seal cup actually governs the plunger length better, and two tiny notches on the seal circumference allow the seal to vent gases from within the plunger. The result: A bubble-tight seal for the most difficult chemical applications, without the use of Teflon. "It's an elegant solution to an expensive problem."

Swell-Resistant Printers Gum Seals

We've worked a special elastomer for use with water-based printing inks. We think of ink as being almost benign, but sometimes it can be rather aggressive to certain materials, and swelling of the rubber typically causes a big problem in the dispensing valves for ink.

Peter Paul has worked with our existing rubber supplier on a specific material for ink that was originally developed for the rubber stamp industry and the automatic mailing label industry. If a rubber stamp were to swell up, the lettering and logo would become distorted...so we've come up with a special material: We've developed an elastomer with customized nitrile rubber and very unique for the printing industry. We

started supplying this in conventional plungers and disk compensated plungers, and we're now starting to supply it in media isolation diaphragms for ink dispensing and retrieval systems, some in high-speed ink jet printers.

Commercial ink jet printers do things like posters and large billboards. They fire all the ink jets at one time and deflect them so they have to practically vacuum away the ink that isn't used. Some of these inks are magnetic so the media isolation valve is really the only way to control the flow of these inks. We found that while a number of diaphragm materials are useable, we picked a specific material for the water-based ink printer. It seems to mold well in existing tooling and is relatively

Normal elastomers and printing inks can sometimes combine to cause swell and hence distortions in the printing industry. So we investigated.

economical in cost, seeming to perform fairly well for the water-based inks. This product is currently available in Series 50 and Series 20 size in the diaphragm media isolation valves.

Solenoid Valves For Low Temperature Applications

Our solenoid valves, those precision electro-mechanical "switches" required to perform millions of unattended cycles in applications ranging from coffee vending machines to metal cutting machine tools, are also widely employed at low temperatures to about -40° C involving gaseous and liquid compounds including refrigerants and liquids nitrogen.

For these uses, the full range of our 2- and 3-way valves can be specified with the Teflon® or Kel-F seals required for processing semi corrosives; typically, all valve parts must be oxygen cleaned to remove oils and other surface contaminants. In many such applications, a compressed liquid is metered by the valve. Many of these valves will be UL recognized and CSA listed.

We can provide a wide variety of solenoid valves and manifolds, if required, for low temperature operation involving refrigerants of liquid nitrogen.

EPDM Seals

Special EPDM (Ethylene Propylene Diene Monomers) solenoid valve seals are used for applications where high-pressure gases tend to be absorbed in standard rubber seals.

When gas is absorbed into a rubber solenoid valve seal, it doesn't normally cause any physical degrading of properties but will cause the rubber to display a phenomenon called explosive decompression. If the system were to be vented or pressure reduced, gas that is trapped inside the rubber tends to cause the seal to balloon and swell, sometimes actually fracturing. Users in the fire extinguisher field, for instance, find that rubber swelling over a period of time may actually causes the fire extinguisher valve to shut off.

Used in place of conventional seal materials, such as urethanes, EPDM is more suitable for specific, hard-to-fill applications such as high-pressure gases used in aerospace projects.

Solenoid valve plunger travel stroke is typically 0.020 to 0.050 in., depending on orifice size. Choosing the wrong seal material could literally shut off the valve flow. Notice the swelling in the seal at right.

Added Moisture Protection Available For Series 50 Explosion-Proof Solenoid Valves

Our Series 50 Explosion-Proof solenoid valves and operators with molded coils for hazardous locations are now offered with added protection from moisture in the form of new O-ring and flat gasket fluorocarbon elastomer seals. The locations of these new seals are shown in the explode view of a coil for an E50 valve (inset).

Added moisture protection provisions for E50 and low watt EL50 and ELL50 miniature Explosion-Proof solenoid valves are now available for Explosion-Proof valves with molded coils requiring added protection from moisture may now be satisfied with new fluorocarbon elastomer O-ring and flat gasket seal to further protect the coil from any possible moisture contamination. While redundant for all but the most arduous process uses, these added seals will still provide a solenoid valve at somewhat lower cost than one with a fully potted coil, top and bottom seals, and an RTV conduit seal.

Designed to meet today's demands for economy of space and energy consumption in hazardous locations, our E50/EL50/ELL50 miniature Explosion-Proof solenoid valves are offered in seven basic designs, based on maximum operating pressure differential, orifice size, CV factor, and operating media. Built to UL standards for safe and continuous operation at maximum rated pressures, the specifications for these general purpose of safety valves for pneumatic and hydraulic applications are conservatively rated at 85% of rated voltage and maximum pressure. In addition to air and other fluids compatible with standard Buna N seals, these valves operate in hot water, steam, gasoline, oil, refrigerant, hydraulic fluid, and other environments requiring special seal materials. Explosion-Proof design with 1/2 NPT conduit connection and stainless steel construction allows these valves to meet the requirements of hazardous locations Class I, Group C and D, and Class II, Group E, F, and G.

FKM Seals Developed For Gasoline And Propane Valve Applications

Today's alternative powered vehicles and reformulated gasolines are causing increased occurrences of solenoid valve seal swelling and cracking in service. This has created the need to reformulate existing FKM compounds to maximize their properties in reformulated gasolines which have significant amounts of MTBE and alcohol.

Additives also have been causing problems with seal integrity, frequently in propane-powered vehicle applications. These fuel applications involve seal swelling with existing standard fluorocarbon elastomers, generically called FKM, but available with trade names such as FKM and Fluorel. We discovered that, by maximizing the fluorine content of their FKM, the swelling was reduced. Further enhancement of the physical properties was made by removing the traditional colorant and adding carbon black. Therefore, the normal color of this new FKM is black.

We see more and more FKM problems in vehicle applications involving solenoid valves, both gasoline powered and alternative fuels (e.g. propane). In some states, reformulated gasoline can be up to 15% MTBE, causing problems with traditional FKM systems. Swelling and rubber decomposition appear with time. Beyond vehicular applications, other related uses, particularly in the medical field, have shown to be more stable and long-lasting when the new FKM is applied.

Solenoid Squirt Valve

Peter Paul Squirt valves Series 15 (left) and Series 50 (right) are part of a family of Squirt valves for process industries and special applications. This valve was originally developed for marking a continuous web of cloth, paper, wood or anything moving on a conveyor which needs to be marked.

Our new Squirt valve is an in-line, two-way Normally Closed Series 50 or 15 solenoid valve with double plunger seal which does not allow continuous flow but will shut off, energized or de-energized. This prevents a continuous flow condition if someone accidentally left the Squirt valve "on". You get one squirt or drop and no more.

Its main claim to fame is probably its size, currently 50 and 15 solenoid valves with a variety of tube sizes which control drop size. Low pressure ratings of two psi to ten psi are available; anything less than two pounds pressure does not provide enough velocity for a good squirt or drop.

Because this valve was originally developed for marking cloth with dye to highlight defects in yard goods, the valve had to meet both small size and low cost requirements. You might call it non-critical dispensing: It doesn't have to be perfectly exact for oil or any light liquid. If you dispense a drop of oil on a bearing before assembling it, the application would be good enough. The same could be suggested with glue, other types of lubricants, sealants...any light liquid dispensed at low pressure in drop increments.

The small dispenser tube is critical only in its diameter and controls drop size and squirt length. The bigger the drop, the shorter the carry.

These mostly stainless steel versions are available in either AC or DC.

Metering Adapter Adds To Utility Of Our Series 20 And 30 Solenoid Valves

Adjustable, stainless steel metering adapters shown mounted on our (left to right) Series 30 grommet valve, Series 30 conduit valve with in-body metering, Series 20 Explosion-Proof conduit valve, and Series 20 with spade terminals and in-body metering.

A new, adjustable, stainless steel metered adapter for Series 20 and 30, 2-way N.O. and 3-way solenoid valves provides a manually adjustable flow control to a valve which creates a speed control for the process the valve is controlling.

While our solenoid valves can be configured with metering in the valve bodies, the use of metering in the sleeve port adapter on either the top inlet or exhaust allows the user to set the best possible flow parameters for the specific application. For instance, to restrict the return speed of a cylinder, the metering adapter acts as a damper on the process. With the use of these adapters, it is also possible to pipe the exhaust from the solenoid valve out of the area rather than exhausting directly to atmosphere. The metering adapters are available for either 1/8 NPT or 1/4 NPT porting and are used for liquid and gaseous media.

The metering adapter is typically used as a metered exhaust for 3-way normally open valves, or as a metered normally open port in multi-purpose or directional control valves.

Universal Mounting Bracket Now Available For Peter Paul Solenoid Valves

Our new universal mounting bracket is shown here attached to (left to right) Series 15, 30, and 50 and 70 solenoid valves. The zinc plated, carbon steel bracket (foreground) is provided with screws.

The bodies of all our solenoid valves offer an underside pair of drilled and tapped holes for easy mounting. But where the mounting surface is very thick or physically inaccessible, a simple top mounting is desirable.

For such applications, we have developed a universal, plated steel mounting bracket, part number B96, for individual, solenoid valves in Series 15, 20, 30, 50, and 70. Provided with screws and several countersunk hole configurations, the brackets are easily installed and may be used in virtually any operating environment.

Manual Override Now Offered On Many Peter Paul Solenoid Valves

Manual override (turn-lock or momentary push button) is a factory option and is available on specified solenoid valves including (clockwise for 10) Series 20, grommet housing, multipurpose; Series 70, conduit housing, 3-way NO; and Series 58, DIN-type connector, 3-way NC.

Manual override, a mechanical device which permits the momentary or locking manual opening of NC valves or the closing of NO valves, is available as a factory option on many models of our Series 58, 20, and 70 solenoid valves.

There are a number of common processing situations in which it may be necessary to actuate a single solenoid valve in a array of valves without disturbing the electrical sequencing or piping to these valves. The manual override option is built into the bodies of these valves and will not affect their normal operation unless actuated in the case of power failure or similar circumstance.

The manual override option adds only marginally to the cost of the valve; other body options, as you know, include metering, metered bypass, manifold mount, flange mount, and orifice metering.

Screw-In Series 20 Solenoid Valve Bodies Offered With Larger Ports

New, brass, and stainless steel screw-in, Series 20 solenoid valve bodies offering simplified assembly, disassembly, and field replacement are now produced with enlarged ports for higher flow applications.

The Series 20 screw-in valve bodies speed and simplify valve-to-manifold attachment in processes involving liquid or gaseous media compatible with brass. Assembled barely more than finger tight, these brass bodies incorporate two O-rings to help eliminate leakage and provide the required high burst pressure ratings. These bodies are offered for use with brass, stainless steel, or anodized aluminum manifolds where media compatibility is not a problem.

These unique, screw-in valve bodies (1/2-20" male UNF-2A port) are available for many of our standard valve models and are used for both conventional, one-piece machined manifolds or with out proprietary modular solenoid valve building block manifolds.

Our large port, screw-in, Series 20 valve bodies for simplified manifold mounting are now offered in brass for compatibility with a broad range of liquid and gaseous process media and with existing brass, anodized aluminum, and stainless steel manifold designs. Dual O-rings in these screw-in valve bodies virtually eliminate the possibility of leakage and provide attractively high burst pressure ratings.

Unique Solenoid Valve Indicates The Location Of Track Flaws For The Railroad Industry

The complete Series 30 spray valve used to mark suspect areas of track for subsequent inspection and repair incorporates a unique lower nozzle section which is removable for cleaning of all parts that come in contact with the oil-base paint which is dispersed by the valve. The valves are part of automated testing systems used by independent rail testing services.

We have developed a special, two-way, Normally Closed solenoid valve used by rail flaw inspection services to pinpoint track problem areas for the railroad industry. Designated the Series 30 spray valve, this 12 VDC, 8 watt, 60 psi valve is part of an ultrasonic or induction detection system used by independent rail testing service organizations for checking each rail, end-to-end, to automatically identify faults, cracks, and railhead (wear) loss. When a flaw is found, the solenoid valve is automatically energized and a yellow, oil-based paint is pressure sprayed through the adjustable valve nozzle, marking the defective area for subsequent identification and repair.

Paint flow is straight through the valve from the adapter on top to the nozzle-like bottom of the brass body, which incorporates a 7/64" orifice. The nozzle portion of the valve is removable so that all of the internal parts, including the nozzle, can be cleaned to prevent clogging. In addition to marking track areas for manual inspection and repair, the track riding test vehicles provide their operators with a visual display of track anomalies including cross-sectional views and railhead wear diagrams and retain these data electronically for off-line analysis and report generation. The design of the Series 30 spray valve has been tested in several similar applications, with particular emphasis on O-ring and seal compatibility with the material being discharged.

High Flow Valve

Low pressures, high flows, compact size, larger flow "passages...that's what's cooking with commercial cookers.

Here's a solution to provide a Series 30 Normally Closed valve for LP and natural gas...very low pressures up to about 2 psi but with high flows ($C_v = .57$), compact size, and economy in a Series 30 valve. As you can see from the photograph, this style has larger flow passages for higher flows through the valve. Larger drilled ports also allow higher flows. While our competitors provide C_v 's of about .40, they probably use multiple valves on smaller burners with more pressure drop. The seal materials are typically FKM, with brass bodies, yoke, and spade coil, most of the appliance-type. For standard equipment, it had to be basically small and economical. High flow is usually needed for commercial cookers and could be used with any kind of gas-fired heaters. They're also employed for incubators and poultry brooders. And these valves might also be useful for decorative gas-fired lights, infrared heaters, small heaters, patio heaters, and more.

Our valve is a very high flow, low cost unit with compact size.

The same technology would potentially apply to gravity feed systems such as lubricators...low pressure lubrication, low pressure dispensing of various materials from a low pressure valve requiring a large orifice, but overall small in size. Perhaps we could provide some samples for you.

Series 50 with Welded Stainless Steel Fittings

Series 50 Welded Fittings

Designed to meet stringent purity requirements in analysis equipment and other applications requiring all welded components. Available with various options including 3-way operation and diode rectifier coils for quiet operation. Continuous operation at maximum rated pressure. Shown as 3-way with welded stainless steel fittings

It may come as a surprise to learn that about 80% of the product information calls involve special, unique, and non-standard applications for our solenoid valves.

For instance, a customer asked us to modify a standard Series 50, 3-way Directional Control valve with stainless steel components and FKM seals for oxygen service to incorporate special welded fittings (one tee and one elbow) with threaded ends as shown in the picture.

These modifications of standard Series 50 drawings took a few minutes to complete by CAD. They were immediately faxed to the customer and approved. The result, as you can see to the left, is a valve with relatively simple external modifications which precisely meets the requirements of the user's application. Five easy steps: Request; drawings, mechanical changes; prototype; production.

High Flow Vacuum Solenoid Valves Developed For Medical & Industrial Applications

New line of solenoid valves for sterilizing medical instruments includes a large air-operated valve with extended plunger stroke for high-flow and a smaller valve, 2-Way, Normally-Closed with 12 VDC power.

We have developed a new series of solenoid valves for use in vacuum chambers for sterilizing medical instruments. These valves feature high flows; bubble-tight; standard vacuum fittings and standard flanges for international use; electron beam seamless welding of flange to body; purity requirements allowing no trapped particles on the inner diameter; several million cycle endurance for critical life operation; and Teflon™ outside coating to eliminate dust and possible wear-creating particles.

Two basic models have been developed: The smaller one is electrically operated with 1/2" orifice, 2-Way, Normally Closed with FKM plunger seals.

The larger of the new valves is air-operated by cylinder with a 1" orifice to meet high-flow requirements. The spring-loaded assembly seals on the orifice for failsafe operation. Assembly of this larger unit also involves electron beam welding. Both valves employ anodized aluminum bodies with all stainless steel inner moving parts. Of particular interest to prospective users, a major medical products producer required elaborate testing of valve open/close times, as well as extensive endurance testing.

Cutaway of large, air-operated valve shows 1" orifice.

Stainless Steel Series 58 Solenoid Valves

Two Peter Paul Series 58 valves with stainless steel bodies are (left) 2-Way, NC, stud mount, and coil with lead wires; (right) 3-Way, NC, piped exhaust, 10/32 ports, and coil with lead wires.

Additions to our line of molded Series 58 solenoid valves have been developed with two stainless steel bodies. These bodies supplement the existing six models of plastic valves currently used in portable medical devices, analyzers, portable test equipment, and similar applications.

These stainless steel bodies represent an option for the 58 valves while retaining all the same coil options, voltages, wattages, orifice sizes, pressure ratings, and elastomers.

Two stainless steel models are offered in both 2-Way and 3-Way versions: A stud mount, utilizing a 10/32 stud as the orifice connection and an annular groove as the cavity connection. These connections are separated and sealed with O-rings. The other body style uses 10/32 female ports for both the cavity and orifice connections. Optionally, the user can upgrade from the plastic bodied Series 58 to either of the stainless steel bodies.

Series 50 Valves Configured For Precision Electronic Production Equipment

Two examples of the new, sealed, Peter Paul Series 50 solenoid valves for electronics and chip manufacture are shown. A 24 VDC, 7.0 watt, 1/16 orifice, 100 psi solenoid valve (top) is offered with grommet housing and 1/4" O.D. stainless steel tubing welded to the body; the sleeve assembly is threaded to the body and sealed with an elastomeric gasket. The valve below incorporates welded 1/8" O.D. input/output tubing but with body and sleeve assembly welded together, eliminating the gasket and threads, for total, positive, permanent sealing.

We've announced a new, completely sealed, Series 50 solenoid valve to meet today's stringent requirements for chip manufacturing, analysis equipment, and other types of ultra high purity equipment requiring welded components.

Available immediately in a 2-way, Normally Closed configuration, the valve can be produced in many AC or DC voltages. These Series 50 valves feature all 430F stainless steel construction with either 1/8" or 1/4" O.D. stainless steel welded tubing as their port connections. The sleeve assemblies of these valves can be attached with conventional threads and elastomeric seals or, for the most critical applications, with the body welded directly to the sleeve assembly. Both grommet and conduit-style housings are offered, with internal electro polish available.

Employing all our standard components for millions of trouble-free operating cycles, these fully sealed Series 50 solenoid valves are available with all standard options including 3-way operation, quiet operating diode rectified coils, and more for continuous operation at maximum rated pressures as required.

. . . Special Options

3-Way and 2-Way Solenoid Valves For Quiet (No-Click) Operation

Peter Paul Electronics Co., Inc. has developed solenoid valves for use in medical applications such as hospital beds, breathing apparatus, and inflatable mattresses for burn patients in which a bumper is installed for quiet operation.

In normal industrial applications, the click of a solenoid valve is not an issue, but in the quiet of a hospital environment it can be nerve wracking to hear constant clicking as the valve is actuated. Several new plunger and bumper designs used in the 3-way function have a top seal but eliminate the metal-to-metal contact.

One way to "eliminate the click" is to put in a rigid top seal that's non-compensating and doesn't move. The top seal contacts the end stop, but no metal contact is made. It requires a unique plunger and uses a special end stop to accommodate it. Many times the pressure ratings are reduced just a bit due to the increased air gap in the valve, affecting magnetic performance. Usually these applications are low-pressure air or vacuum, therefore the reduced rating of the valve is generally not an issue.

Rectified coils are also often specified in medical equipment, either full bridge or half bridge, to eliminate the potential for noise. A valve, which might potentially cause a hum or buzz can be very annoying to a patient, so a full wave rectified unit for AC service is often preferred. A DC unit, not requiring a rectifier, is sometimes used in specific applications.

Also common is a bumper in a 2-way valve, usually just a flat disk with no sealing action. Bumpers may be urethane or filled Teflon or special low cold-flow Teflon, which doesn't become deformed like virgin Teflon.

Typical Peter Paul Electronics 3-way and 2-way solenoid valves for use in medical applications such as hospital beds, breathing apparatus, and quiet, no-click operation (shown on cutaway).

Occasionally, a bumper is included in a valve for a non-medical application where long life is critical. With a bit more cost, a Teflon-coated plunger combined with a bumper will provide very long, quiet valve life under many operating conditions.

Diode Rectified Solenoid Valve Coils For Quiet Operation

Most solenoid valves now in operation are powered by AC current, primarily because AC voltages are more readily available. AC solenoids have faster pull-in (cycle) times, with a ratio as high as 3:1 compared to DC power. However, AC or DC powered valves have a natural tendency to audibly "click" at the beginning of each on-cycle and can sometimes, under adverse conditions, emit a low, but audible hum in operation.

While perfectly acceptable for the majority of applications, valves destined for quiet environments, such as hospitals, often cannot accept the possibility of a hum or, in extreme cases, a buzz. Further, in an AC valve, anything that will prevent proper mating of the plunger pole faces, including dirt and corrosion, can cause noisy operation. In addition, AC solenoids, because of the in-rush current and fast cycling, can evidence higher heat rise than would be experienced under steady-state conditions, another problem in hospital/medical/ laboratory applications. The reactance on AC solenoids increases progressively, reducing the current as the plunger moves into its seated position. If the plunger is restricted, the temperature will increase as the square of the current.

All of these inherent AC valve conditions have led us to provide many AC valves with diode rectified coils, allowing the valve to run on DC power for cooler and quieter operation in application where these are required. Fortunately, semi-conductor diodes are considerably less expensive today than in the past, and their use has not caused a significant cost increase where DC operation is necessary.

Operating on DC, the valve plunger need not be seated on its stop in order to prevent coil burnout, and the typical DC solenoid exhibits a longer life because it is not subjected to the peak voltages produced by the more broadly cycling AC current. The closed gap pull force is greater on DC than AC for the same pole area. Normally the AC pull curve has a sharper bend at each peak or valley, while the DC curve is consistently flatter.

Given the many superior properties of solenoid valves with diode rectified coils converting AC input power to DC operation, and the increase in medical-oriented applications where these DC valve capabilities are desirable, we are able to offer most basic solenoid valves with a diode rectified coil to meet specific user criteria. For applications which require it, a 4-diode full wave bridge also is available.

Location of the rectified fly back diode array in DC rectified solenoid valve coil is shown (cutaway). Most of our valves can be so configured, including the Models 50, 20, and 30 (left to right) above, all specified with diode rectified coils for the inherent low noise/low temperature provided by DC operation. They are used primarily for low noise/low temperature quiet locations such as hospitals and laboratories.

Peter Paul Water-resistant Valves for Submerged Operations

Peter Paul Electronics Co., Inc., offers water-resistant solenoid valves featuring a fully encapsulated coil, for applications where exposure to moisture or even complete submersion is necessary.

The Series 15 or 50 valves are intended for a wide range of outdoor uses including HVAC/R, irrigation systems, off-road equipment, trucks, buses, trains or other vehicles experiencing significant exposure to wet environments, including boat trailers, controls, engine and bilge areas. The valves feature a liquid epoxy potted coil assembly and a rugged housing covered with a baked-on epoxy/polyester finish rated at 1000+ hours in a 5% salt spray test. The potting provides increased heat transfer capabilities through elimination of trapped air pockets for a cooler running valve.

All internal parts are constructed of stainless steel and brass. Corrosion resistant materials are used for exposed parts. The standard version operates on a 12 VDC, single lead power connection. Dual power lead versions can be used for mounting on non-conductive surfaces such as fiberglass, plastic or wood. Additional power options are also available.

Encapsulated Diode Spade Coil For Series 15 Solenoid Valves

A full wave bridge can now be encapsulated into the coil assembly Series 15 solenoid valves. By embedding the required electronics in the coil, a DC valve can be driven by common AC voltages.

Each valve's encapsulated coil contains a diode circuit that converts common 50/60 Hz voltage to DC. Running the coil on DC eliminates the in-rush current associated with AC valves, thus limiting the excessive heat build-up encountered with frequently cycled valves. The use of DC coil voltage also allows the use of an elastomeric damper within the valve itself. This damper reduces the audible click which occurs on actuation as well as increases the life of the valve, for a wide range of hospital and laboratory applications.

Electrical Connectors

These solenoid valves are factory-equipped with the required pin connectors and as-specified leads and lead lengths to allow the installation of valves by maintenance personnel without the need for on-site electrical engineers.

It is recognized that solenoid valves can be configured with numerous coil options, voltages, orifice sizes, pressure ratings, elastomers, footprints, and more. In addition, there are a wide range of attachments and add-ons such as splice boxes, mounting brackets, manifolds, and more to enhance the utility of the solenoid valve.

To provide even more value-added aspects to our valves, these solenoid valves are offered with many electrical connectors, allowing on-the-floor maintenance staff personnel to disconnect and switch solenoid valve connections without the need for an electrical engineer. These electrical connectors include male or female pins and connectors, custom lead lengths, junction box connectors, and other simple fasteners which can be handled on the plant floor or in the field. Typical electrical connectors include pin styles, receptacles, housings, flag connectors, and two- or three-pin flange connectors. While the add-on costs of these pins and connectors are nominal, their inclusion at the factory make the solenoid valves of which they are a part installation-ready as received by the user.

Time Delay Coils Check Process Before Media Flow

This time delay coil with built-in thermistor (cutaway) is at the heart of the Peter Paul Series 30 solenoid valves employed on many oil burners.

Time delay coils with built-in thermistors have been developed for our Series 30 solenoid valves. The thermistor circuit in the solenoid valve coil delays the pick up of the valve's plunger from 2 to 6 seconds. This allows the solenoid to be certain of the required process parameters before media flow commences.

A common example is the start-up sequence for an oil burner . It is vital that a sensor in the furnace's electrical circuit "sees" that a flame has been generated to continue the flow of fuel oil. If there is no flame, oil flow may flood the burner, often requiring maintenance of an extended period of time before a re-start can be initiated. When the call activates the burner , the solenoid valve's time delay function allows the pump and fan/motor to reach operating speed before starting fuel flow.

Series 30 solenoid valves, UL recognized and CSA listed, are frequently used in these boiler and furnace applications because of their economical pricing and compact size.

Dual Voltage Solenoid Valve Coils

Dual voltage, four-wire coil and completed dual voltage solenoid valve (Series 20, left and Series 50, right) are used when two voltages may be involved in a process, typically 120/240 VAC or 240/480 VAC.

For many small AC motor applications including powered hand tools, it has become quite common for the motors to be configured to operate at one of two voltage levels, typically 120/240 VAC-60 Hz OR 240/480 VAC-60 Hz.

Now for the Series 20, 50, 60 and 80, 2-, 3-, and 4-way solenoid valves, we can provide dual voltage coils to allow the solenoid valves to be wired for either of the applicable voltages, reducing parts inventory and product installation / assembly at the distributor, OEM, and end user locations.

For specific applications in which more than one voltage might be encountered, the dual voltage solenoid valves are identical to their single-voltage versions except for the additional coil windings and leads.

Series 58 Super Sub-Miniature Coils

These coils were specifically designed for small places. The Sub-Miniature coil mounts on our existing Series 58 Bodies, ie Stainless Steel Screw-In or 10-32 Ports and our standard plastic bodies, Manifold Mount or 10-32 Ports. These valves are ideal for micro electronic production equipment and medical or chemical analytical applications where space is limited. Also, can easily be suited for any value added OEM application, as shown with special brass fittings and accessories. Consult factory for size, pressure ratings, orifice sizes and power requirements.

Splice Box Option Allows Field Wiring For All Peter Paul Conduit-Style Solenoid Valves

An optional, 2-3/16" x 1-25/32" x 1-1/2" splice box housing has been announced by Peter Paul Electronics Co., Inc., New Britain, Connecticut, to allow field wiring directly to any Peter Paul conduit-style solenoid valve.

Designed to save a conduit run and remote connection box, the copper brazed steel splice box offers three, standard, 7/8" diameter knockouts to provide wiring access from different locations. Solenoid valve coil leads are 6", #18 wire; a ground terminal screw is provided inside the box. Optional wall or panel mounting brackets may also be specified as required.

Any standard Peter Paul Series 20, 30, 50, or 70 Series solenoid valve can be mated to the splice box, which will be UL listed for use with UL listed valves.

The splice box housing option, shown here with a variety of Peter Paul solenoid valves, provides space for multiple wiring hookups, three 7/8"

Splice Box Option Allows Field Wiring For Peter Paul Solenoid Valves

An optional, redesigned and streamlined splice box, with either conduit box or configuration for Romex open wiring, has been announced by Peter Paul Electronics Co., Inc., New Britain, Connecticut, to allow field wiring directly to any Peter Paul Series 20 (stainless steel) or Series 30 (brass) solenoid valve.

Designed to save a conduit run and remote connection box, the more universal splice box allows quick and inexpensive field wiring connections to the valve. Any standard Peter Paul Series 20 or 30 solenoid valve can be mated to the splice box, which is UL listed for use with UL listed valves.

Splice Box option for Peter Paul Series 20 (stainless steel, left) and Series 30 (brass, right) solenoid valves provides space for multiple wiring hookups and an easy access cover for quick and inexpensive field wiring connections directly to the solenoid valve. Splice Boxes shown here with user-provided wire connectors.

MISCELLANEOUS OPTIONS

SEAL MATERIAL

Peter Paul Electronics offers a large selection of optional seal materials. Standard seal material for catalog valves is nitrile elastomer, a good general purpose compound, satisfactory for most applications. Insert materials such as FKM, Nordel, KeL-F®, and Teflon® are available for applications where excessive heat is a factor, or for use with any media that can cause insert swelling or deterioration. Consult factory for proper usage.

COLOR CODED
SEAL INSERTS

Trade Name	Color Code
Hypalon®	Green
Kalrez®	Black
Neoprene®	Red
Neoprene®	Black
Nylon®	Opaque
Teflon®	White
Urethane®	Yellow
FKM	Brown
Santoprene®	Off-White
KEL-F®	Opaque
Nitrile (Buna N)	Blue
Nordel	Gray
Silicone	Red

UNIVERSAL MOUNTING BRACKET

"The Flat Mounting bracket"

Series 20, 30, & 50 valves can be secured to bracket using tapped hole in bottom of valve body. Order Part No. 20-2416.

OPTION A — ALUMINUM SHADING RING

Used on valves where media is harmful to standard copper ring, but will not attack aluminum rings.

OPTION S — SILVER SHADING RING

Used on valves where media is harmful to standard copper ring, but will not attack silver rings.

OPTION V — BUILT IN MUFFLER

Compact muffler located in valve outlet port to silence excessive noise. Muffler location will vary according to valve type — 3 WNC Valve Muffler in sleeve exhaust port, 2 WNC Valve Muffler in body outlet port, etc.

MANIFOLD MOUNTING Option "E"

FLANGE MOUNTING Option "H"

FILTERS & MUFFLERS

INLINE FILTERS FEATURE:

- RUGGED ALL-BRASS CONSTRUCTION
- 1/8 & 1/4 NPT SIZES
- AVAILABLE IN 20, 40, 60 & 100 MICRON RATINGS

FILTER/STRAINERS FEATURE:

- RUGGED ALL-BRASS CONSTRUCTION
- 1/8 NPT CONNECTIONS
- 43 MICRON STAINLESS STEEL SCREEN
- EASY SERVICE WITHOUT DISTURBING FLUID CONNECTIONS

EXHAUST MUFFLERS FEATURE:

- RUGGED ALL-STAINLESS CONSTRUCTION
- SINTERED STAINLESS MUFFLER ELEMENT
- COMPACT DESIGN — LOW PROFILE
- 1/8 & 1/4 NPT SIZES
- LOW NOISE LEVEL
i.e., Exhaust noise of 3WNC V valve at 100 psi and 200 CPM reduced from 99dBA to 75dBA (measured at 3 feet from Muffler)
- CAN BE USED AS BREATHER VENT FILTER

All Peter Paul filters and muffers are designed for maximum flow with minimum restriction and are compatible with all common media not reacting with brass or stainless steel.

PRODUCT NUMBER CHART				
DESCRIPTION	PART NUMBER	PIPE SIZE	MICRON SIZE	MATERIAL
INLINE FILTER	F520-A	1/8 NPT	20	BRASS
	F540-A		40

MUFFLER	M875-C	1/8 NPT	75	430F SS
	M975-C	1/4 NPT	75	430F SS

EXAMPLE: Inline Filter 1/4 NPT 60 Micron Brass Body No.F660-A

FILTER/STRAINER

The Peter Paul Filter Strainers are designed for the customer who needs efficient filtration of large contaminating particles along with ease of servicing. The 43 Micron screen has a large filter area and can be cleaned without removing the filter body from the system.

SPECIFICATIONS:

Pipe Size: 1/8 NPT $C_v = .23$
Screen Rating: 43 Micron or 140 Micron
Max. Working Press. Diff.: 300 PSI
Burst Press.: 4000 PSI
Temp.: -40° to +200°F
Materials: Brass Body & Filter Hsg., Stainless Strainer & Flange Cap
 Buna N Seals
Media: All non-corrosive liquids & gases

INLINE FILTER

The Peter Paul Inline Filters are designed to be a convenient "last chance" filter which provides maximum protection for all fluid power devices. Female/Male pipe threads are provided for ease of installation. Available in four micron ratings.

SPECIFICATIONS:

Pipe Size: 1/8 or 1/4 NPT
Micron Rating: 20, 40, 60, or 100
Max. Working Press. Diff.: 300 PSI
Element Burst Press. Diff.: 1500 PSI
Temp.: -40° to +300°F
Materials: Brass Body with sintered Bronze Filter Element
Media: All non-corrosive liquids & gases

EXHAUST MUFFLER

The Peter Paul Exhaust Muffler is designed for use with air cylinders and control valves or wherever excessive noise due to exhausting air is a problem. These mufflers will fit into any 1/8 or 1/4 pipe port and will reduce exhaust noise substantially, yet will not cause excessive restriction.

SPECIFICATIONS:

Pipe Size: 1/8 or 1/4 NPT
Max. Working Press. Diff.: 400 PSI
Element Burst Press. Diff.: 4000 PSI
Temp.: -40° to +300°F
Materials: Stainless Steel Body with Sintered Stainless Element (75 Micron)
Media: Air and most gases

HOUSING OPTIONS Constructed of stainless steel, plated and painted steel. Styles include strain relief connector , single automotive, double automotive, AN connector, splice box, yoke, conduit, grommet, bracket, JIC housing, potted coil & housing.

DOUBLE

OPTION Q
STRAIN RELIEF CONNECTOR
SUPPLIED WITH SJT LEADS

OPTION S
"AN" CONNECTOR

OPTION Y
MAGNETIC YOKE

OPTION N
SPLICE BOX

OPTION J

J.I.C. HOUSING (SERIES 20 ONLY)

When additional solenoid protection is required, Peter Paul's J.I.C. Enclosure may be applied. In addition to meeting J.I.C. Standards, this unit fulfills requirements for many NEMA Types. See listings in column at left. Maintenance is simplified, because removal of electrical conduit is unnecessary upon unit disassembly. Available with pigtail wire in Peter Paul Solenoid valves or in Peter Paul valve operators for OEM application.

BRACKET DIMENSIONS FOR ALL SERIES

MAINTENANCE AND CLEANING INSTRUCTIONS SERIES 20, 30, & 50 VALVES

1. Shut off the pressure to the valve and electric current. The valve need not be removed from the line.
2. Remove nut at the top of the housing. Bottom flux plate (if present), housing and coil can then be removed from the body (the series 70 also has a Yoke inside the housing).
3. Using the special Peter Paul wrench (Part GP-010, GP-007 or GP-191) unscrew the sleeve assembly from the body. DO NOT use a pipe wrench, since a wrench may crush or mar the sleeve assembly and make the valve inoperative.

INSPECTION

1. If the valve fails to operate, the coil and control circuitry should be checked to make sure it is not burned out or open.
2. Occasionally, if mishandled, valves may leak at the flange seal. If the medium is a liquid, such a leak may damage the coil. A flange leak may be corrected by tightening the sleeve assembly into the valve body or replacing the gasket. Use wrench, Peter Paul Part GP-418 or GP-191.
3. If the valve leaks at the seat or the plunger sticks in the energized position, examine the soft inserts in the plunger and the inside of the sleeve assembly for the presence of excessive dirt or wear. If the inserts show considerable wear, the plunger should be replaced.

4. If the valve develops a loud buzzing noise, examine the inside of the sleeve assembly and upper portion of the plunger and remove all foreign matter imbedded in these parts. **Caution:** in Three-Way and Two-Way Normally Open Valves, be careful not to damage the sleeve seat. Do **not** clean plunger assembly or seals with any type cleaning fluid.

REASSEMBLY:

Reassemble the valve by following the disassembly procedure in reverse order. Make sure the seal of the flange end of the assembly and the return spring are in place when the sleeve is screwed into the body. After screwing the flange into the body and before assembling the coil to the valve, it is advisable to apply pressure to the port which leads to the body chamber and check for leakage around the flange. If the valve has a sleeve port, this port at the top of the valve must be capped to make this test. If the medium is air or gas, leakage can be noted by applying water to the joint and watching for air bubbles. If the medium is liquid, leakage is readily apparent. **DO NOT** tighten the nut at the top of the coil housing excessively, since doing so will put undue strain on the sleeve assembly.

REPLACEMENT PARTS:

Orders for replacement parts should include (1) Part Description, (2) Valve number, (3) Voltage.

Install in 5 minutes

Directions:

With wrench supplied remove top nut and housing. Using the same wrench remove sleeve assembly plunger, spring, and seal. Discard all these underlined items do not re-use any portion of them.

Insert new components supplied. The re-assembled valve is ready for service. This simple operation brings the valve to the original performance level.

When ordering repair packs, add "AC" or "DC" to complete pack number (example) Pack No. K 21GDX AC

Repair pack consists of: Sleeve Assembly-Plunger-Spring-Seals-Wrench

Repair packs are listed along side of corresponding valve numbers beginning on page 6. Consult factory for repair packs not listed.

REPAIR PACKS

Another Peter-Paul innovation. The pack consists of critical components necessary to bring valves back into service, quickly and conveniently. The life of our quality valves can be extended economically and effectively in this manner.

Definitions & Nomenclature Used In This Manual & Industry

Bubbletight Sealing — zero leakage between the internal sealed ports of a valve in either the energized or de-energized position. Test is based on the air and soap bubble type.

Current Drain — the amount of current expressed in amperes that flows through the coil of a solenoid valve when it is energized.

Compensated Plunger — a plunger designed to compensate for top insert problems that occur on application conditions of high heat when used with water, gasoline, etc. This condition causes standard inserts to swell or shrink, resulting in leakage. The compensated plunger design permits the top insert to move up or down to provide long life and a bubbletight seal at the top of the orifice. **Standard in all valves at no extra cost.**

Continuous Duty — a rating given to a valve that can be energized indefinitely without overheating or failure under normal operating conditions.

C_v factor — The C_v factor of a valve is the quantity of 60° F water expressed in gallons per minute, which will flow through a valve with a one PSI pressure drop. C_v factors for Peter Paul solenoid valves are indicated in the catalog listings in each section.

Cycle — a complete operation of a solenoid valve. For example: opening a normally closed valve and then closing it is one cycle.

Cycle Rate — the number of times a valve is capable of opening and closing its main orifice in a particular time interval.

Cycles per Minute (CPM) — the number of times a valve is capable of opening and closing its main orifice in one minute.

Dead End Gas Service — a condition in which two-way normally open or three-way valve applications require continuous energization or repetitive cycles for over 2 hours.

Drip Proof — see NEMA classifications

Drip Tight — see NEMA classifications

Dust Tight — see NEMA classifications

Duty Cycle — the longest time that a valve is energized, followed by the shortest time that it is de-energized.

Explosion-Proof Construction — a solenoid valve constructed to meet the specifications of the Underwriters' Laboratories, Inc. for operation in hazardous locations. See also NEMA classifications.

Flow — the continuous movement of fluid created by a pressure differential.

Flow Rate (Valve) — the amount of fluid through a valve in reference to pressure drop across the valve to carry magnetic flux from the housing to the sleeve assembly. A flux plate is required only on valves having a non-magnetic body material.

General Purpose Valves — valves suitable for application indoors under normal atmospheric conditions. See also NEMA and U.L. classifications.

Hazardous Locations — as defined by Underwriters' Laboratories, Inc. most Peter Paul explosion-proof valves are listed for use in the following hazardous locations: Class I, Group D, Class II, Group F and G. See also NEMA classifications.

Class I Locations — are those in which flammable gases or vapors are or may be present in the air in sufficient quantities to produce explosive or ignitable mixtures. Group D atmospheres are: gasoline, hexane, naphtha, benzene, butane, benzol, propane, alcohol, acetone, lacquer, solvent vapors, and natural gas.

Class II Locations — are hazardous because of the presence of mixtures of combustible dust. Group F atmospheres contain carbon black, coal or coke dust. Group G atmospheres contain flour, starch or grain dust.

Intermittent Duty Coil — a valve coil not designed for continuous duty but which will perform satisfactorily for a specified duty cycle.

Heat Rise — the difference between the temperature of the solenoid coil when energized and de-energized. As current flows through a coil, heat is generated. The coil temperature rises until the coil and valve construction dissipates additional heat as fast as it is generated, and the temperature stays at a stabilized level.

Insert — a material used in a plunger assembly to seal an orifice.

Definitions & Nomenclature (Continued)

Insert Material - Color coded for easy identification

Buna-N — a soft synthetic rubber used as the standard insert material in Peter Paul valves.

Kel-F — a synthetic plastic material used for many semi-corrosive media.

Neoprene — a soft synthetic rubber used as an insert material on certain types of Freons.

Nordel — a soft synthetic rubber used as an insert material on certain water and steam applications.

Nylon — a synthetic plastic material used for semi-corrosive media where Kel-F is not suitable.

Teflon — a synthetic plastic material used for semi-corrosive media where Kel-F or Nylon is not suitable.

Viton — a soft synthetic rubber used for high temperature and with many fluids not handled by Buna-N or Nordel.

Leakage, External — the leakage between the internal part of the valve and the external part of the valve. All Peter Paul valves have no external leakage.

Leakage, Internal — the leakage between the internal sealed ports of a valve in either the energized or de-energized position. All Peter Paul Standard Valves with standard (Buna-N) inserts are bubbletight when applied as rated.

Manual Override — a mechanical device that permits manual opening of normally closed valves or closing of normally open valves.

Metering — a mechanical device that permits manual adjustment of fluid flow through a valve. Sometimes referred to as speed control.

Oxygen Service — valves **specified** for use with oxygen are furnished free of any oil. Special cleaning may be required and should be so specified.

Port — an opening or passageway for the inlet or outlet of fluid in a valve. The terminus of the port is threaded with National Pipe Threads (NPT) to accommodate line connection. A port designated with an NPTF port indicates one with dry seal threads. A port designated with a PTF indicates one with short dry seal threads.

Port, Cylinder — a port which provides a passage to or from an actuator. This port is a common port and in multi-purpose valves is called a common port.

Port, Exhaust — a port which provides a passage to the atmosphere, or the return lines of a system.

Port, IN — a port which provides a passage from the source of fluid.

Port, OUT — the port where the fluid leaves the two-way valve.

Port, normally closed — the port that is closed to fluid flow when the valve is de-energized.

Port, normally opened — the port that is open to fluid flow when the valve is de-energized.

Power Consumption — the number of watts a solenoid valve draws when it is energized.

Pressure — is a potential force used as a propellant of air or fluid. Pressure is induced into a system by means of a pump, compressor, or by gravity. Absolute pressure is measured in pounds per square inch absolute (PSIA). Absolute pressure is the reference of pressure with 0 used as a base. Gauge pressure (or PSIG) is the reference of pressure with 14.7 pounds per square inch at sea level as a base.

Pressure, Burst — is the minimum pressure that would cause the weakest section of the valve to fail and cause external leakage.

Pressure, Differential (Drop) — is the difference in pressure measured between any two given points.

Pressure, Maximum Operating Pressure Differential — the maximum difference in pounds per square inch between the pressure at INlet port and the pressure at OUTlet port at which a solenoid will operate, either to open or to close one or more ports when energized or de-energized.

Pressure, Proof — is that pressure which may cause malfunction of the valve without permanent damage, i.e., the valve will operate properly when the pressure is reduced to normal operating range.

Pressure, Ratings:

Higher than Standard — are pressure ratings which can be made available through minor changes on a solenoid valve. In most cases, this is possible only when UL approval is not a factor.

Standard Catalog — are pressure ratings established to conform to Underwriters' Laboratories, Inc., and to do so under the most adverse conditions of pressure, low or high voltage, maximum heat rise, etc. The standard ratings listed in this catalog should be considered as conservative.

Response Time — the length of time required for the operating mechanism of a valve to move from the fully closed position to the fully open position, or vice versa. Response time will vary according to pressure, media, voltage and system. The response times shown in the catalog are based on average conditions.

U. L. and CSA Terms Nomenclature and Listings

Most standard Peter Paul series 20, 30, and E20 are U.L. and CSA listed. **All** Peter Paul Valves, including those not U.L. and CSA listed, use the high standards of U.L. as the minimum standard for performance. A copy of the U.L. and CSA cards regarding Peter Paul's valve listings is enclosed. The valves are listed under the following U.L. and CSA Guide Numbers and categories:

1. U.L. Guide No. 440 A5 (Valves Electrically Operated) Safety and General Purpose Valves.
2. U.L. Guide No. 440 A5-C (Component-Valves, Electrically Operated) Safety and General Purpose Valves.
3. U.L. Guide No. 440 AO (Valves, Electric, For Use in Hazardous Locations) Safety and General Purpose.
4. U.L. Guide No. 384 OO (Solenoids for Use in Hazardous Locations).
5. CSA Guide NO. 440-A-O, Class 3221 (Solenoid Valves)

Some terms and nomenclature as defined and used by Underwriters' Laboratories, Inc.:

General Purpose Valve — a valve intended to control the flow of a fluid, but not depended upon to act as a safety valve. It may be normally closed or a normally open valve.

Safety Valve — a normally closed valve of the "on" and "off" type intended to be actuated by a safety control or by an emergency device to prevent the unsafe delivery of a fluid. It may also be used as a "general purpose valve."

Hazardous Fluids — gases and liquids which are usually considered to be combustible, highly corrosive, or toxic such as acetylene, strong acids and alkalis, ammonia, anesthetics, liquefied petroleum, manufactured and natural gases, combustible oils, oxygen, etc.

Hazardous Locations — locations in which "hazardous fluids" may be present in the air in sufficient quantities to produce explosive or ignitable mixtures.

Peter Paul Explosionproof Valves and Solenoids are U.L. listed for use in the following hazardous location groups as defined by Underwriters' Laboratories:

Class I, Group A — Atmospheres containing acetylene.

Class I, Group B — Atmospheres containing acrolein, butadiene, ethylene oxide, hydrogen, propylene oxide.

Class I, Group C — Atmospheres containing ethyl-ether vapors, ethylene or cyclopropane.

Class I, Group D — atmosphere containing gasoline, hexan, naphtha, benzine, butane, propane, alcohol, acetone, benzol, lacquer, solve vent vapors, or natural gas.

Class II, Group E — atmospheres containing metal dust, including aluminum, magnesium, and their commercial alloys, and other metals of similarly hazardous characteristics.

Class II, Groups F and G — atmospheres containing carbon black, coal or coke dust, flour, starch or grain dust.

PETER PAUL ENCLOSURES FOR VARIOUS NEMA REQUIREMENTS:

NEMA (National Electrical Manufacturers Association) Standards for Electrical Enclosures are defined as listed below. The specific Peter Paul housing arrangements that meet these requirements are described below.

NEMA 1. GENERAL PURPOSE

To prevent accidental contact, protection from dust, but not dust tight. All Peter Paul standard housings, with **non-molded** or **molded** coils meet this requirement.

NEMA 2. DRIP TIGHT

To prevent accidental contact and to exclude falling moisture or dirt, Peter Paul **J.I.C. housing** with **non-molded** or **molded** coils are suitable.

NEMA 2. DRIP PROOF

To prevent accidental contact and protection against falling moisture or spray from interfering with operation. All Peter Paul standard housings with **molded** coil or Peter Paul **J.I.C. housing** with **non-molded** or **molded** coils meet this requirement.

NEMA 3. WEATHER RESISTANT

To provide suitable protection against falling moisture or spray from interfering with operation. All Peter Paul standard housings with **molded** coil or Peter Paul **J.I.C. housing** with **non-molded** or **molded** coils meet this requirement.

NEMA 4. WATER TIGHT

To provide entrance of water after a specific hose test. Peter Paul **J.I.C. housing with non-molded coil**, molded, or potted coil meets this requirement.

NEMA 5. DUST TIGHT

To prevent entrance of dust by use of gaskets or equivalent. Peter Paul **J.I.C. housing** meets this requirement with **non-molded** or **molded** coil, or potted coil.

U. L. and CSA Terms Nomenclature and Listings (Continued)

NEMA 6. SUBMERSIBLE

Constructed so that it will operate successfully when submerged in water under specific conditions of pressure and time. Liquid potted coils meet this requirement.

NEMA 7. — AND UNDERWRITERS' LAB. CLASS I — GROUP D — EXPLOSION PROOF

Where flammable gases are present, specifically, gasoline, hexane, naphtha, benzine, butane, propane, alcohol, acetone, benzol, lacquer solvent vapors and natural gas. **Non-molded** or **molded** coils in Peter Paul explosion proof valves meet this requirement.

NEMA 8.

As above (NEMA 7) except unit is oil immersed. Peter Paul **explosion proof valves** with **molded coils** meet this requirement. (Class I - Group D and Class II - Group F and G.)

NEMA 9 AND 9A AND UNDERWRITERS' LAB CLASS II— GROUP F AND G

Where combustible dust is present. Specifically, Group F (carbon black, coal or coke dust) and Group G (flour, starch and grain dust). **Non-molded** or **molded** coils in Peter Paul explosion proof valves meet this requirement.

COIL TEMPERATURE CLASS CHART

Class A	105 C / 221 F
Class B	130 C / 226 F
Class F	155 C / 311 F
Class H	180 C / 356 F
Class N	200 C / 392 F
Class C	220 C / 428 F

Valve Types and Function

The basic Peter Paul Valves are electromagnetically actuated, direct operating, solenoid-type valves with resilient inserts that seal upon the orifice.

De-energized - When a valve is de-energized it is said to be in its "normal condition" and no current flows through the electrical coil winding.

Energized - When current is permitted to flow through the coil and the resultant magnetic flux overcomes the fluid pressure and spring force and brings the plunger up against the stop.

Normally Closed Valve - a valve in which the inlet orifice is closed when the coil is de-energized and open when the coil is energized.

Normally Open Valve - a valve in which the inlet orifice is open when the coil is de-energized and closed when the coil is energized.

Multi-Purposed Valve - a valve which has combinations of normally closed, normally open or normally closed and normally open orifices in one valve unit which are opened or closed by energizing or de-energizing the coil.

Directional Control Valve - a valve in which the inlet is open to the normally closed port when the coil is energized.

Two-Way Valve - a valve that has a single orifice which may be normally open or normally closed.

Refer to the cross-sectional drawings on the following pages for the desired valve description.

Two-Way Normally Closed (2 W.N.C.) - a valve in which the orifice is closed in the de-energized position and no flow can exist between the inlet and outlet ports.

Two-Way Normally Open (2 W.N.O.) - a valve in which the orifice is open in the de-energized position and no flow can exist between the inlet and outlet ports.

Two-Way Dual Purpose Valve (2 W.D.P.) - a valve that will function properly with rated pressure at either the IN port or OUT port in the energized or de-energized position.

Three-Way Valve - a valve that has two orifices and three ports. One orifice is always open when the other is closed and one port is always open to one of the other two ports. Flow is controlled by opening or closing either of the two orifices.

Three-Way Normally Closed (3 W.N.C.) - a valve in which inlet orifice is closed and the exhaust orifice is open in the de-energized position. No flow can exist between the inlet cylinder ports. Full flow can exist between the cylinder and exhaust ports.

Three-Way Normally Open (3 W.N.O.) - a valve in which the inlet orifice is open and the exhaust orifice is closed in the de-energized position. Full flow can exist between the cylinder and exhaust ports.

Three-Way Directional Control (3 W.D.C.) - a valve in which the inlet is open to the normally open port when the coil is de-energized and open to the normally closed port when the coil is energized.

Three-Way Multi-purpose (3 W.M.P.) - a valve in which will function as three-way normally open, as three-way normally closed, and three-way directional control, depending on piping hookup.

Direct Action Valve - a valve in which flow is controlled directly by the plunger and the spring in the magnetic circuit and is not dependent on any other factors. There are only two moving parts.

Internal Pilot-Operated Valve - a valve that operates on a minimum and maximum pressure differential and uses a small orifice size "direct acting" valve to open and close a much larger main orifice size valve. The main orifice is operated and closed by pressure differential across a diaphragm, spool or piston built into the main valve body.

External Pilot-Operated Valve - a valve that operates in a similar manner to the internal type except that the pilot valve operated from a separate source of pressure.

Servo-Valve - a valve sometimes referred to as a "proportioning valve." The extent of orifice opening or flow is controlled by extent or amount or electrical signal inputs.

Synthetic Insert Material for Valves

Color Coded for easy Identification

The information is a general guide and can be changed due to media and type of valve being considered.

Type	General Purpose Buna N	FKM	Neoprene®	EPDM

COMPENSATED PLUNGERS

Peter Paul supplies compensated plunger in all cases at no extra charge.

WHAT IS A "COMPENSATED PLUNGER"

The "Compensated Plunger" permits the top insert to move up and down thus providing long life and bubble-tight sealing at the top orifice. The design provides a metal-jacketed top insert that is spring loaded. This plunger is offered with various insert materials to suit different applications. It is offered with Standard Buna-N (no charge). FKM, EPDM, Neoprene, Teflon, Kel-F or Nylon insert material are available.

WHY A COMPENSATED PLUNGER IS USED

A general property of rubber products is to dry, shrink and harden with the application of heat. Another property is the change in volume and swelling that takes place in liquids. Various liquids and chemical formulations will affect different insert materials to varying degrees.

The specific advantages of a compensated plunger are when:

1. A liquid media is being used in a Three Way Valve or a Two Way Normally Open Valve.
2. A Three Way Valve or a Two Way Normally Open Valve is continuously energized for two hours or longer.
3. A Three Way Valve or a Two Way Normally Open Valve is operating at a high cycle rate (greater than 200 C.P.M.)
4. A Three Way Valve or a Two Way Normally Open Valve is operating at a long duty cycle (such as "On Time"=1 hour, "Off Time" = 10 minutes)
5. A Three Way Valve or a Two Way Normally Open Valve is "dead ending" (no flow when energized) for repetitive cycles that have an "On Time" greater than 1 1/2 hours.
6. A Three Way Valve or a Two Way Normally Open Valve is being used with media of excessive temperature.
7. A combination of the above-consult factory on any questionable applications.

TYPE OF INSERT MATERIAL TO APPLY

Refer to the above table describing each insert material. Consult factory for any questionable applications and for other Seal Material options.

Metering Options

When a critical or controlled amount of flow is required, a metering device is incorporated in the valve body. This allows adjustment of flow through the valve from nearly zero to fully open for pressures up to 300 PSI. If a metering device is required for higher pressures, consult the factory.

Two basic metering devices are offered. These are the "stem" (option "F") and the "screw" (options "T" standard) and "A" (fine). Other metering functions offered are "metered by-pass" (option "W") and "metered sleeve, to atmosphere" (option "U").

Standard Screw Type Metering (T)

This is a precision tapered screw and is used to adjust the flow of orifice sizes 3/64 to 1/8 inch. It can meter flow down to a degree of extremely low leakage. If bubble-tight leakage is required, consult the factory. This type of metering can be fabricated to meter the flow through the valve body cavity port or the valve body orifice port. Thus, if two 3 Way Valves are used to operate a double acting cylinder, the forward stroke, return stroke, or both strokes of the cylinder may be adjusted to obtain a given required operating speed by desired valve and metering selection. The "Standard" Screw-Type Metering travels from closed to full orifice opening in approximately 2 1/2 turns. Stock valves are fabricated to adjust orifice port flow.

Fine Screw Type Metering (A)

This is a precision tapered screw to give fine adjustment of orifice sizes 3/64 to 1/8 inch. The fine metering screw is 4 xs finer in adjustment than the standard. Thus if the standard metering takes 1/4 of a turn from closed position to obtain desired metering, the fine would take one full turn to adjust to the same point. The full adjustment range of the fine metering is approximately 2 1/2 turns (same as standard). It can adjust flow down to extremely low leakage (bubbles). If bubble-tight leakage is required, consult the factory.

Stem Type Metering (F)

This metering device is for orifice sizes 5/32 to 1/4 inch. Seven full turns are required to fully open a 1/4 inch valve body orifice. This metering device can not be adjusted to bubble-tight leakage and is only offered as an orifice port metering device.

Metered By-Pass (W)

This type of metering device is offered when an adjustable flow is required to pass through the valve regardless of whether the valve is energized or de-energized and whether the orifice being opened or closed. Thus a by-pass with a metering device is fabricated into the valve body. Consult the factory with specific requirements.

Adjustable Sleeve Exhaust (U)

This is a metering device that is placed in the top of the sleeve assembly and exhausts to atmosphere. This is particularly useful in adjusting an air operated cylinder's return stroke speed.

All metering options are described and listed in that section of the catalog. Metering location is considered standard as listed. Check customer's location requirement. Apply standard location, if at all possible. The metering can be offered with directly opposite location. If the quantity is large enough there will be no extra charge. If other locations are required consult the factory.

Manual Override (Y)

This is mechanical device that permits a person to operate the valve by either hand or screwdriver. This is useful in case of a power failure or to assist in machine or system set-up or test.

The manual override location is listed in that section of the catalog. These locations are standard and are a stock item. The manual override can be offered with directly opposite location.

GANG FEEDING OPTION

In application where numerous solenoid valves are connected to the same supply line, considerable savings can be achieved by eliminating fittings. This can be done by using a multi-ported valve body where one of the pipe ports is a feed-through supply.

Using this method, the feed-through ports can be connected in a line resulting in a simplified piping. Only one valve requires connection with the main supply line. This feature can be offered in a 2 Way or 3 Way valves.

Application

Vending Machines: Where different valves are connected to the same water line, but the outlet feeds different circuits.

Packaging Machines: Where the air supply is required to actuate different cylinders at different times, but feed from the same source.

Automation: So that more valves can fit in a limited space.

GANG FEEDING (continued)

Specification:

Gang feeding can be applied in both 1/8 or 1/4 NPT pipe ports.

Applicable on series 20 and 30 valve lines.

Gang feeding can be applied on 2 Way or 3 Way valves.

Connecting Pipe: Standard straight pipe 1/8 or 1/4 NPT with a minimum length of 1.0 inch.

2 Way Normally Closed: Two inlet ports and one outlet port. Valve can be fed from either of the inlet ports, while the other inlet port is connected with the inlet port of the next valve in the line.

3 Way Normally Closed: Two inlet ports and one cylinder and exhaust port. One inlet port is connected with the next valve's inlet port. If the two valves are "ganged" it is equivalent to a 4 Way Valve.

Directional Control: Two inlet ports and one N.C. and one N.O. port. One of the inlet ports is connected to the next valve in line and a multi-directional valve is obtained. (More than 2 directions, depending on the number of valves.

Orifice Size: Any valve body with standard orifice can be supplied.

VALVES FOR MANIFOLD MOUNTING

Peter Paul Electronics Co. produced two types of Solenoid Valves which can be mounted on a manifold.

Bottom Mounted Manifold Feed: (Print No. 20-3025)
Suitable for applications where the valve's body can be mounted by using two 10-32 holding screws at the bottom of the valve body. The advantage of this method is the economical utilization of space, lower cost and immediate availability.

Flange Mounted Manifold Feed: (Print No 20-3012)
Suitable for application where the valve's body has to be mounted from the upper end (Face) of the manifold. Since mounting is accomplished by a flange, the space requirement is greater than the bottom mounted manifold feed. Customer must use the two locating holes to avoid mis-application.

Sleeve Port: Since the sleeve port is not part of the valve body, its connection to the manifold, if necessary, has to be made by using copper tubing or by using flexible hoses.

COIL TYPES

Peter Paul manufactures all coil in our own plant to rigid manufacturing and quality standards. This makes for excellent availability and delivery of all types for all voltages.

The only coils presently U.L. listed are types V and M.

Non-Molded (Type V)—Class A rated at 105° C.—IEEE* and 110° C. Continuous & 125° C. Intermittent—U.L.

Molded (Type M)—Class F rated at 155 ° C.—IEEE* and 110° C. Continuous & 125° C. Intermittent—U.L.** The coils are moisture proof.

High Temperature Molded (Type H)—Class H rated at 180° C.—IEEE* and 160° C. Continuous & 175° C. Intermittent—(Non-Published) U.L.** The coils are moisture resistant.

POTTED (Type P)—Class F rated at 105°—IEEE* and 110° C. Continuous & 125° C. Intermittent—U.L.** Peter Paul Rating*** 125° Continuous. The unit is water proof.

IEEE—The temperatures listed are the limiting temperature definitions by this organization for insulation material categories.

****U.L.**—The temperatures listed are the maximum permissible temperatures for the total of coil resistance temp, rise and ambient temp for the complete coil.

COIL SELECTION FOR SERIES 20, 30, 40, 50 & 70 VALVES

In selecting coils for various “odd voltage” requirements, the following formula should be observed.

If an applied voltage (A.C.) falls between the rated voltage of two coils (rated voltage appears on Coil Charts), take 40% of the difference in voltage between the two coils and add to the lower voltage rating. If the resulting figure is equal to or larger than the applied voltage, the coil with the lower voltage rating should be used. If the resulting figure is smaller than the applied voltage, the coil with the higher voltage rating should be used.

Example: Field Voltage 130v/60cy.
The 2C-115 Coil has a rated voltage of 138v/60y.
The 2C-114 Coil has a rated voltage of 120v/60y.
18v (difference)

40% of 18 Volts7v
120v (lower volt. rating)
127 v is the max. 60 cy.
Voltage for 20C-114

Therefore, a 2C-115 coil should be used with a field Voltage of 130 volts 60 cycles.

Coils selected under the above formula will operate successfully at 10% below and 10% above the nominal applied voltage.

This general rule for coil selection should only be used with “Standard Valves” in the Series 20, 30, 40, 50, & 70 operated under “Standard Conditions”. For clarity, definition of what is meant by “Standard Valves” and “Standard Conditions” follows.

Non-Molded

Molded

Potted

Technical Information

General

The following table will assist in determining the suitability of Peter Paul valves for a wide range of common media.

Media Variables

Quite often the exact chemical composition, concentration or application conditions can vary the corrosive effect of some media. In these cases Peter Paul must be consulted and the code note (PP) appears. When requesting recommendations in these cases the following information must be provided.

1. Exact composition of media.
2. Concentration of media.
3. Temperature range.
4. Pressure range.
5. Length of exposure.
6. Allowable Leakage.
7. Valve life expectancy.

Uncommon Media

Often requests are received to recommend valves for media with which we've had no prior experience and which do not appear in tables furnished by the Steel, Rubber and Plastic manufacturers.

In such cases the prospective customer is often in the best position to know what materials are compatible. Thus, there is a table that follows listing Peter Paul Valve materials.

Note

- (1.) The following recommendations are limited to Media whose temperature range between 0 F. and 180 F. Consult Peter Paul when either lower or higher temperatures are expected.
- (2.) Three-Way normally closed valves that exhaust to atmosphere are usually restricted to air service.

SOLENOID VALVES . . .

SERIES 20 & 30 AIR FLOW CHARTS

AIR FLOW EXAMPLE

This chart directly correlates the anticipated air flow rate to initial pressure, final pressure and pressure drop for a given orifice.

EXAMPLE: Find the two-way normally closed valve than can deliver 5 CFM of air at 70°F and 200 PSIG inlet pressure if the pressure drop across the valve is 25 PSI. On the valve pressure rating chart you find that a 1/16 orifice is recommended for 200 PSI pressure drop. Draw a vertical line (dotted line) from 175 PSI "final

pressure" line up to the curve of initial pressure 200 PSI. Draw a horizontal line from this point to the 1/16" orifice scale. Read the flow rate - 7.3 CFM.

The chart also can be used to establish required pressure drop if orifice size and required flow is known. Merely reverse the above procedure. When low pressure is involved, it is easier to obtain accurate flow rate using the enlarged flow chart.

SERIES 20 & 30 WATER FLOW CHARTS

WATER FLOW EXAMPLE

This chart directly gives the anticipated water flow if the orifice size and pressure drop are known.

EXAMPLE: Establish the flow through a 1/8" orifice, two-way, normally closed valve if the inlet pressure is 80 PSIG, and the outlet pressure in 70 PSIG.

The pressure drop across the valve is 80-70 or 10 PSIG. At the intersection of the 10 PSIG and the 1/8" orifice lines (dotted lines) drop down to the flow scale and read 0.8 GPM.

EXAMPLE

2 Series 20 Valve	3 3 way Norm. Closed	N K 1/8 Inlet 3/32 Exhaust	9 Stainless Steel Valve Body 1/4" NPT Ports	Y Z Manual 1/4" Override NPT	C Conduit Housing	M Molded Coil	120 120 Volt Line	60 AC 60 Hertz
-------------------------	-------------------------------	--	--	------------------------------------	-------------------------	------------------	----------------------------	----------------------

NOTE: "G" Marked prior to the valve number denotes Gang Feeding.
 "E" Marked prior to the valve number denotes Explosion Proof.
 "H" Marked prior to the valve number denotes High Pressure V valve.
 "F" Marked prior to the valve number denotes Filter V valve.

Where numerous options are specified, valves will be marked with 2 numbers to identify valve series and type, followed by specifically assigned numbers.

* For 3 way valves this number will consist of two suffix letters. The first indicates the inlet orifice & the second the exhaust orifice.

** For valves with a combination of two standard body options, this suffix will consist of two letters.

**** In Series 70 -1/16 - 5/16 Orifice.

† For series H high pressure valves only.

†† 2 in Series 15 is 1/8 NPT Aluminum only.

††† Letter K followed by "M" in 7th digit column indicates molded spade terminal coil & yoke.

The Founders of Peter Paul

Paul Mangiafico

Josephine Mangiafico

The Family History that's Your Valve Advantage

Peter Paul continues its history as a driving force in solenoid valves since 1947. Founded as a family business by Paul and Josephine Mangiafico right after World War II, the company is currently managed by first, second and third generation family members in a range of responsibilities. What this means for you is that the people with whom you deal today will be there to answer to you tomorrow.

This family commitment ensures that you get personal attention from a company sized to address your needs. Peter Paul has grown with the demand for its high service philosophy, quadrupling its plant from 7,000 to 28,000 square feet in 1977. By 1988, the company had grown to 130 employees and 77,000 square feet.

Now, you get a company whose size and manufacturing capabilities ensure innovation and quality with rapid response. Beyond that, you can always talk with a family member to ensure optimum satisfaction because at Peter Paul, customer retention starts with the family.

Warranty

Peter Paul Electronics Co., Inc. (seller) warrants its products to be free from defects in workmanship and material. Under normal use and service, Peter Paul products will perform very satisfactorily. The seller's obligation under this warranty shall be limited to the repairing, free of charge, any part or valve which, after his examination, shows it to be defective. Of course, normal wear and tear must be considered and exempted. No representative or person is authorized to assume for the seller any other obligation or liability in connection with the sale of its products.

All engineering and technical advice are offered free of charge, in a spirit of helpfulness to the buyer. This assistance is based on data which Peter Paul considers reliable and is intended to be used by knowledgeable and skillful personnel at their own risk.

The seller shall not be liable for consequential damages in case of failure to meet conditions of any guarantee or shipping schedule, nor claims for labor, loss of profits, repairs or other expenses incidental to replacement.
